PT Isolation of satellite sequences from genomic DNA for use as DNA markers
PT comprises isolating a library with high homogeneity by DNA fragmentation.
XX
PS Example 5; Page 14; 35pp; Japanese.
XX
CC The invention provides a novel method for isolation of satellite
CC sequences from genomic DNA that comprises fragmentation of the DNA by a
CC method which is not dependent on base sequences, then selection of the
CC satellite sequences from the obtained genomic library of high
CC homogeneity. The method is useful for the isolation of microsatellite DNA
CC sequences which can be used as DNA markers. The new method markedly
CC improves the efficiency of isolation of satellite sequences in comparison
CC to prior art methods which are reliant on base sequences. Sequences
CC AAZ98483-514 represent sequences from Haliotis discus, used in the method
CC of the invention

PT Polynucleotides comprising polymorphic variants of a reference sequence

PT for tumor necrosis factor receptor 1 (TNFR1), useful for studying the
PT biological function of TNFR1 and identifying drugs targeting the protein
PT for treating disorders.
XX
PS Example 1; Page 30; 79pp; English.
XX
CC The present invention relates to polymorphic variants of the tumour
CC necrosis factor receptor 1 (TNFR1) gene. The sequence of the gene is
CC given in AAA95102, AAA95103 and AAA95104. The polymorphisms were
CC identified by amplifying and sequencing regions of the gene. Twelve
CC polymorphic loci were discovered. Of these twelve polymorphisms, four can
CC cause a change in the TNFR1 protein. The present sequence is a primer
CC used to amplify part of the TNFR1 gene. The TNFR1 polymorphisms may be
CC useful for studying the biological function of TNFR1 as well as for
CC identifying drugs targeting the protein for treatment of disorders
CC related to its abnormal expression or function such as tumours, apoptosis
CC related disorders and bacterial infection

XX
PS Claim 3; Page 47; 110pp; English.
XX
CC The present invention specifically claims AAH56368 to AAH56832 which are
CC antisense oligonucleotides to nucleotide sequences encoding groE. More
CC generally, antisense compounds (I) comprising antisense oligonucleotides
CC of 5-50 bases targeted to a nucleotide sequence encoding groEL (heat
CC shock protein (HSP)60) (GL) and groES (HSP10) (GS) gene from a
CC microorganism, where the antisense compound is complementary to GL or GS
CC of a microorganism and specifically hybridises with and inhibits the
CC expression of GL or GS, is claimed. (I) have antibacterial, antiviral and
CC antiproliferative activities, and can be used in antisense therapy and
CC for inhibition of expression of groES or groEL. (I) are useful for
CC inhibiting expression of GL or GS in cells or tissues in vitro. (I) are
CC also useful for inhibiting the growth of a microorganism, or inhibiting
CC the expression of GL or GS gene in a microorganism (a bacterial cell or a
CC virus) having a GL or GS gene which involves administering to the
CC microorganism or to a cell infected with the microorganism, (I). (I) are
CC also useful for treating a mammalian pathological condition mediated by
CC the microorganisms which involves identifying a eukaryotic organism
CC having a pathological condition mediated by microorganisms having a GL or
CC GS gene and administering (I) such that the growth of microorganism is
CC inhibited. The antisense compounds are utilised for diagnostics,
CC therapeutics, prophylaxis and as research reagents and kits, e.g., to
CC prevent or delay microbial infections in humans. They are also useful as
CC molecular weight markers. AAH56362 to AAH56367 and AAH56833 to AAH56854
CC represent PCR primers for groE sequences which are used in the
CC exemplification of the present invention. AAH56855 to AAH56870 represent

PT   Kit for detecting presence of polymorphisms linked to gene associated
PT   with familial dysautonomia (FD), comprises specific primers which detect
PT   polymorphisms, D9S309 and D9S310 identified in candidate region for FD
PT   gene.
XX
PS   Claim 1; Col 15; 28pp; English.
XX
CC   The present sequence for PCR primer #1 is used with PCR primer #2
CC   (AAS09266) to amplify DNA marker D9S310. Various oligonucleotide
CC   sequences (AAS09239-AAS09272) are described in an invention relating to
CC   the detection of polymorphisms associated with familial dysautonomia
CC   (FD). The FD gene has been mapped to chromosome 9q31-q33 by linkage with
CC   10 DNA markers in 26 FD families. A kit to detect the presence of
CC   polymorphisms linked to a gene associated with FD, the Riley-Day syndrome
CC   (an autosomal recessive disorder characterised by developmental loss of
CC   neurons from sensory and autonomic nervous system) in an individual,
CC   comprises a nucleic acid primer of at least 15 contiguous nucleotides and
CC   at least one other reagent. The kits are useful for diagnosing familial
CC   dysautonomia and the test can be used prenatally to screen a foetus, or
CC   presymptomatically to screen a subject at risk in affected FD families

CC   The invention relates to a nucleic acid molecule which provides one or
CC   more accessory functions for supporting recombinant adenoassociated virus
CC   (rAAV) virion production in a suitable host cell. The molecule comprises
CC   a VA RNA coding region, E4 open reading frame (ORF) 6 coding region, E2A
CC   72kD coding region, E1A coding region and E1B region lacking an intact
CC   E1B55K coding region of an adenovirus (AV). An accessory function vector
CC   comprising the molecule is useful for producing rAAV. The method
CC   comprises introducing AAV vector into a suitable host cell, introducing
CC   an AAV helper construct into the cell, where the helper construct
CC   comprises AAV coding regions that are expressed in the host cell to
CC   complement AAV helper functions missing from AAV vector, introducing the
CC   accessory function vector into the cell; and culturing the cell to
CC   produce rAAV virions. The method can alternately be performed by two
CC   other methods. The molecule yields significant levels of rAAV particles
CC   without also generating significant levels of infectious helper virus or
CC   contaminating by-products. Sequences AAI67722-23 represent oligos used
CC   for causing E1A alterations

PT Collection of binding groups for determining or typing samples,
PT especially clinical samples, has groups capable to identify essentially
PT all members of the family of nucleic acids of relatively high
PT significance.

XX
PS Disclosure; Page 17; 166pp; English.
XX
CC The present invention describes a collection of binding groups for a
CC family of nucleic acids comprising members of relative high and relative
CC low significance, where the binding groups are selected to be capable to
CC identify, alone or in combination, essentially all members of the family
CC of nucleic acids of relatively high significance. The collection of
CC binding groups is useful for typing of nucleic acid in a clinical sample,
CC by contacting the nucleic acid with the collection and determining
CC whether one or more binding groups bound to the nucleic acid of the
CC sample. This method is useful for determining whether the sample
CC comprises at least a part of a member of relatively high significance of
CC a family of nucleic acids. The collection of binding groups is useful for
CC diagnosing the severity of a disease caused by a pathogen containing a
CC member of a family of nucleic acids. ABL88779 to ABL89321 represent
CC oligonucleotide sequences used in the exemplification of the present
CC invention

PT Amplifying the HIV pol region using specific primers and a sequencing the
PT product using specific sequence primers allows detection of known drug
PT resistance mutations and so determination of viral genotype.
XX
PS Claim 8; Col 13-14; 12pp; English.
XX
CC This invention describes a novel method of analysing an HIV target
CC nucleic acid which comprises amplifying the target sequence using primers
CC specific for the HIV pol region (encoding the viral protease and reverse
CC transcriptase) and analysing the amplified product. The invention is used
CC to determine viral genotype of HIV infections by detecting known drug
CC resistance mutations in the HIV pol gene. The detection of mutations
CC conferring drug resistance in the HIV pol gene is significant in
CC determining drug sensitivity of the virus. A 1.57 kilobase region of the
CC HIV pol gene is a particularly important region containing clinically
CC relevant mutation. This sequence represents a seqencing primer used in
CC the detection of clinically important regions of the HIV pol gene
CC described in the invention

PT Identifying molecules involved in lipid regulation, useful for
PT diagnosing, treating or preventing e.g., arteriosclerosis, comprises
PT identifying a molecule that binds to high bone mass gene or its
PT corresponding wild type gene.
XX
PS Disclosure; Page 38; 409pp; English.
XX
CC The invention relates to a method for identifying a molecule involved in
CC lipid regulation comprising identifying a molecule that binds to or
CC inhibits binding of a molecule to high bone mass (HBM) or its wild type
CC gene, Zmax1. Compounds identified by the method are useful for treating,
CC diagnosing, preventing or screening for normal and abnormal lipid-
CC associated conditions, including arteriosclerosis, cardiovascular
CC disease, stroke, and osteoporosis. The compounds may also be used in the
CC treatment or prevention of diabetic atherosclerosis, neurovascular
CC conditions caused by plaque build-up, poor circulation due to plaque

CC build-up and associated poor wound healing. The methods may be used in
CC gene therapy, pharmaceutical development, and diagnostic assays for bone
CC development disorders. Molecules identified by comparison of Zmax1 and
CC HBM systems can be used as surrogate markers in pharmaceutical
CC development, in diagnosis of human or animal bone disease, and in the
CC treatment of bone diseases. Sequences ABK22776-ABK23411 represent cDNA
CC molecules encoding human Zmax1 and HBM, and PCR primers, probes, linkers

PT Detecting a polymorphism linked to a gene associated with familial
PT dysautonomia, involves analyzing human chromosome 9 for the presence of
PT the polymorphism.
XX
PS Claim 14; Page 10; 17pp; English.
XX
CC This invention relates to a novel method for detecting a polymorphism
CC linked to a gene associated with familial dysautonomia (FD). Familial
CC dysautonomia is an autosomal recessive disorder characterised by the
CC developmental loss of neurons from the sensory and autonomic nervous
CC system. The method of the invention comprises analysing human chromosome
CC 9 and detecting the presence of a polymorphism located between the
CC genetic markers D9S53 and D9S105 inclusive, and linked to the gene
CC associated with familial dysautonomia. The invention also includes
CC nucleotide sequences for detecting a polymorphism associated with
CC familial dysautonomia. Using the method of the invention it was possible
CC to show that the gene for FD is located on human chromosome 9q31-q33. The
CC method and sequences of the invention are useful for the diagnosis of
CC familial dysautonomia and for the identification of carriers of the
CC disease gene, such information will facilitate prenatal diagnosis and

```
CC   help reduce the number of new cases of FD. The present sequences
CC   represent an oligonucleotide primer that can be used to screen for the
CC   D9S310 genetic marker on chromosome 9, this primer is used in the method
CC   of the invention to screen for the familial dysotonomia gene

PT   Determining methylation status of CpG dinucleotides using modified
PT   genomic sequences, oligonucleotides and/or PNA-oligomers, useful in the
PT   characterization, grading, staging and/or diagnosis of colon cancer.
XX
PS   Claim 26; Page 167; 219pp; English.
XX
CC   The present invention describes a method for determining the methylation
CC   status of CpG dinucleotides within the genes for oestrogen receptor, p21,
CC   p27, p16, progesterone receptor, myoglobin, pcna, cdc2, c-erB2, p53
CC   and/or CEA, which comprises contacting the target nucleic acid with a
CC   reagent that distinguishes between methylated and non-methylated CpG
CC   dinucleotides, and determining from the methylation status of the CpG
CC   positions the presence of a colon cancer. A set of oligomers or peptide
CC   nucleic acid (PNA)-oligomers can be used as probes for determining the
CC   cytosine methylation state and/or single nucleotide polymorphisms (SNP)
CC   of a corresponding genomic DNA by analysis of a chemically pretreated
CC   genomic DNA. The pretreated genomic DNA is useful for the determination
CC   of the methylation status of a corresponding genomic DNA and/or detection
CC   of SNPs. The methods and pretreated genomic DNA are also useful for the
CC   characterisation, classification, diagnosis and differentiation of colon
CC   cell proliferative disorders. ACF62752 to ACF63278 represent sequences

CC   positions the presence of a colon cancer. A set of oligomers or peptide
CC   nucleic acid (PNA)-oligomers can be used as probes for determining the
CC   cytosine methylation state and/or single nucleotide polymorphisms (SNP)
CC   of a corresponding genomic DNA by analysis of a chemically pretreated
CC   genomic DNA. The pretreated genomic DNA is useful for the determination
CC   of the methylation status of a corresponding genomic DNA and/or detection
CC   of SNPs. The methods and pretreated genomic DNA are also useful for the
CC   characterisation, classification, diagnosis and differentiation of colon
CC   cell proliferative disorders. ACF62752 to ACF63278 represent sequences
CC   used in the exemplification of the present invention

CC   The invention relates to novel transgenic animals expressing the high
CC   bone mass (HBM) gene, expressing the corresponding wild type HBM gene,
CC   comprising an alteration of the gene encoding LRP5 or LRP6, or expressing
CC   an LRP5 that is modulated by an altered gene control sequence introduced
CC   by homologous or non-homologous recombination. The transgenic animals are
CC   for the study of bone density modulation or bone mass modulation. The
CC   invention has osteopathic and cytostatic activity. The polynucleotides of
CC   the invention may have a use in gene therapy. The transgenic animals and
CC   nucleic acids are for the study of bone density modulation, where the
CC   bone mass is modulated relative to non-transgenic animals of the same
CC   species in more than one parameter selected from bone density, bone
CC   strength, trabecular number, bone size, or bone tissue connectivity. The
CC   transgenic animals, nucleic acids and methods are useful for identifying
CC   molecules involved in bone development, and for developing pharmaceutical
CC   compositions, which may be employed for treating or preventing bone
CC   diseases, e.g. osteoporosis, osteomalacia, rickets, Paget's disease, or
CC   neoplasms of the bone. The transgenic animals and nucleic acids are also
CC   useful in methods for diagnosing diseases involved in bone development,
CC   or characterised by reduced bone density or mass. The present sequence is

PT   New oligonucleotides, useful for rapid detection of beer-spoilage
PT   bacteria by in situ hybridization, are specific for type, genus or
PT   species.
XX
PS   Claim 1; SEQ ID NO 167; 88pp; German.
XX
CC   This invention describes novel oligonucleotides used in a method for
CC   detecting beer-spoilage bacteria in a sample. The bacteria detected
CC   include lactic acid bacteria of the genera Lactobacillus or Pediococcus,
CC   especially the species L. coryniformis, L. perolens, L. buchneri, L.
CC   plantarum, L. fructivorans, L. lindneri, L. casei, L. brevis or P.
CC   damnosus or Gram-negative bacteria of the genera Pectinatus and
CC   Megasphaera, specifically P. frisingensis, P. cerevisiiphilus and M.
CC   cerevisiae. The oligonucleotides of the invention provide rapid detection
CC   of spoilage bacteria (typically within 48 hours, compared with 7-12 days
CC   for conventional culture methods), can detect all relevant bacteria in
CC   parallel, can differentiate between species of the same genus, and are
CC   easy to use. ADE14806-ADE15247 represent the oligonucleotides used in the
CC   method of the invention.

PT   Concurrent interrogation of a number of polymorphic sites, useful for
PT   genetic testing, carrier screening, genetic profiling, and identity
PT   testing, comprises conducting a multiplexed elongation assay using
PT   probes.
XX
PS   Example 6; Page 44; 143pp; English.
XX
CC   This invention relates to a novel method for the concurrent interrogation
CC   of a number of polymorphic sites in the presence of, and without
CC   interference from, non-designated polymorphic sites. Specifically, it
CC   comprises conducting a multiplexed elongation assay by applying one or
CC   more temperature cycles to achieve linear amplification of the target or
CC   a combination of annealing and elongation steps under temperature-
CC   controlled conditions. Furthermore, this detection method uses probe
CC   extension or elongation and relies on enzymatic recognition, a superior
CC   technique that no longer depends on differential hybridisation. The
CC   present invention describes probes and methods useful for identifying or
CC   detecting polymorphisms at one or more designated sites, such that they
CC   can identify mutations within the cystic fibrosis conductance
CC   transmembrane regulator (CFTR) or the human leukocyte antigen (HLA)
CC   genes. In addition, concurrent interrogation of a multiplicity of
CC   polymorphic sites is useful for genetic testing, carrier screening,
CC   genotyping or genetic profiling, and identity testing. This
CC   oligonucleotide is human probe SSP16, one member of a pair of probes
CC   containing a single nucleotide polymorphism at the 3' terminus that is
CC   used in a model HLA typing reaction, in an exemplification of the
CC   invention.

XX

CC The invention relates to a novel pharmaceutical composition, which has a
CC first active agent comprising an oligonucleotide antisense to the
CC initiation codon, coding region, 5' or 3' end genomic flanking regions,
CC 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of
CC junctions of genes encoding a polypeptide associated with lung and/or
CC nasal airway dysfunction and a second active agent comprising an
CC antiinflammatory steroid and ubiquinone. A composition of the invention
CC has antiinflammatory, antiallergic, antiasthmatic, hypotensive,
CC immunosuppressive, and cytostatic activity. The composition may have a
CC use in antisense gene therapy. The composition is useful for treating or
CC preventing a respiratory, lung or malignant disease or condition, also
CC for enhancing the prophylactic or therapeutic respiratory effect of an
CC antiinflammatory steroid in a subject, for reducing or depleting levels
CC of, or reducing sensitivity to adenosine, reducing levels of adenosine
CC receptor, producing bronchodilation, increasing levels of ubiquinone or
CC lung surfactant in a subject's tissue, or treating bronchoconstriction,
CC lung inflammation, lung allergies, or a respiratory disease or condition.

CC The invention relates to a novel pharmaceutical composition, which has a
CC first active agent comprising an oligonucleotide antisense to the
CC initiation codon, coding region, 5' or 3' end genomic flanking regions,
CC 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of
CC junctions of genes encoding a polypeptide associated with lung and/or
CC nasal airway dysfunction and a second active agent comprising an
CC antiinflammatory steroid and ubiquinone. A composition of the invention
CC has antiinflammatory, antiallergic, antiasthmatic, hypotensive,
CC immunosuppressive, and cytostatic activity. The composition may have a
CC use in antisense gene therapy. The composition is useful for treating or
CC preventing a respiratory, lung or malignant disease or condition, also
CC for enhancing the prophylactic or therapeutic respiratory effect of an
CC antiinflammatory steroid in a subject, for reducing or depleting levels
CC of, or reducing sensitivity to adenosine, reducing levels of adenosine
CC receptor, producing bronchodilation, increasing levels of ubiquinone or
CC lung surfactant in a subject's tissue, or treating bronchoconstriction,
CC lung inflammation, lung allergies, or a respiratory disease or condition.

PT Pharmaceutical composition for treating asthma, has antisense
PT oligonucleotide containing less percentage of adenosine, targeted to
PT nucleic acids associated with lung airway or lung dysfunction, and
PT bronchodilating agent.
XX
PS Claim 15; SEQ ID NO 12605; 763pp; English.
XX
CC This invention describes a novel composition (a) a first active agent,
CC comprising oligonucleotides, effective for alleviating
CC bronchoconstriction, respiratory tract inflammation, allergies and
CC reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors,
CC surfactant depletion or hyposecretion, when administered to a mammal. The
CC oligonucleotides are derived from a gene encoding or regulating
CC expression of a target polypeptide associated with lung airway or lung
CC dysfunction or cancer and can be anti-sense to the corresponding mRNA.
CC The invention also describes a kit, that comprises: (a) a delivery
CC device, in separate containers, (b) the oligonucleotides, (c)
CC instructions for adding a carrier and for use of the kit. The composition
CC of the invention has antiallergic, antiinflammatory, antiasthmatic,
CC analgesic, hypotensive, immunosuppressive and cytostatic activity, is a
CC beta-adrenergic agonist. The composition is useful for preventing or
CC treating a respiratory, lung or malignant disease. The administered
CC composition comprises oligo and is administered to reduce the production
CC or availability, or to increase the degradation of the target mRNA or to
CC reduce the amount of target polypeptide present in the lungs. The
CC pulmonary obstruction, and/or bronchoconstriction and/or lung
CC inflammation, allergies and/or surfactant hypoproduction are associated
CC with a disease or condition such as pulmonary vasoconstriction,
CC inflammation, allergies, asthma, impeded respiration, respiratory
CC distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary
CC hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary
CC transplantation rejection, pulmonary infections, bronchitis or cancer.
CC The reduced adenosine content of the anti-sense oligos corresponding to
CC thymidines present in the target RNA serves to prevent the breakdown of
CC the oligonucleotides into products that free adenosine into the system
CC e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to
CC prevent any unwanted effects due to it

PT Analyzing an HIV target nucleic acid sequence by amplifying the double-
PT stranded nucleic acid template derived from HIV to produce amplified
PT target sequences and analyzing the amplified target sequences.
XX
PS Claim 8; SEQ ID NO 5; 14pp; English.
XX
CC The present invention relates to a method for analysing a HIV pol gene
CC nucleic acid sequence. The method comprises combining a double-stranded
CC nucleic acid template derived from HIV, first and second primers, a
CC temperature-stable DNA polymerase and deoxyribonucleotides, amplifying
CC the double-stranded nucleic acid template to produce amplified target
CC sequences, and analysing the amplified target sequences. The determined
CC sequence can be compared to the sequence of known drug mutations in the
CC HIV pol gene. The method of the invention is useful for HIV sequencing
CC and genotyping. The present sequence represents a sequencing primer used
CC in the method of the invention.

XX
CC   The invention relates to oligonucleotides anti-sense to an initiation
CC   codon, coding region, 5' or 3' intron-exon junction, intron or region
CC   with 2-10 nucleotides of the 5'-end or 3'-end of a nucleic acid target
CC   chosen from a gene encoding interleukin (IL)-4 receptor, interleukin (IL)
CC   -5 receptor, CCR1, CCR3, Eotaxin-1, RANTES, MCP4, CD23, ICAM, VCAM,
CC   tryptase a, tryptase b, PDE4 A, PDE4 B, PDE4 C or PDE4 D. The invention
CC   also relates to a method of screening a candidate compound that binds to
CC   one or more nucleic acid target(s) or expressed product(s), for the
CC   prevention and/or treatment of a respiratory or lung disease. The
CC   oligonucleotides are useful for reducing or inhibiting expression of a
CC   gene or mRNA encoding interleukin-4 receptor, interleukin-5 receptor,
CC   CCR1, CCR3, Eotaxin-1, RANTES, MCP4, CD23, ICAM, VCAM, tryptase a,
CC   tryptase b, PDE4 A, PDE4 B, PDE4 C, or PDE4 D. The oligonucleotides are
CC   useful for preventing or treating a respiratory or lung disease. The
CC   respiratory or lung disease is associated with hyper-responsiveness to
CC   and/or increased levels of, adenosine and/or levels of adenosine A
CC   receptor(s), and/or asthma and/or lung allergies associated with
CC   inflammation or an inflammatory disease. The respiratory or lung disease
CC   is chosen from airway inflammation, allergy, asthma, impeded respiration,
CC   cystic fibrosis (CF), chronic obstructive pulmonary disease (COPD),
CC   allergic rhinitis, acute respiratory distress syndrome, pulmonary
CC   hypertension, lung inflammation, bronchitis, airway obstruction or
CC   bronchoconstriction. This sequence represents an oligonucleotide of the
CC   invention.

PT   Novel single or multiple target oligonucleotide anti-sense to e.g.
PT   initiation codon, intron of respiratory disease-relevant gene e.g. CCR1,
PT   RANTES, MCP4, useful for prophylaxis or treating respiratory disease e.g.
PT   asthma.
XX
PS   Example 5; Page 163; 174pp; English.
XX
CC   The invention relates to oligonucleotides anti-sense to an initiation
CC   codon, coding region, 5' or 3' intron-exon junction, intron or region
CC   with 2-10 nucleotides of the 5'-end or 3'-end of a nucleic acid target
CC   chosen from a gene encoding interleukin (IL)-4 receptor, interleukin (IL)
CC   -5 receptor, CCR1, CCR3, Eotaxin-1, RANTES, MCP4, CD23, ICAM, VCAM,
CC   tryptase a, tryptase b, PDE4 A, PDE4 B, PDE4 C or PDE4 D. The invention
CC   also relates to a method of screening a candidate compound that binds to
CC   one or more nucleic acid target(s) or expressed product(s), for the
CC   prevention and/or treatment of a respiratory or lung disease. The
CC   oligonucleotides are useful for reducing or inhibiting expression of a
CC   gene or mRNA encoding interleukin-4 receptor, interleukin-5 receptor,
CC   CCR1, CCR3, Eotaxin-1, RANTES, MCP4, CD23, ICAM, VCAM, tryptase a,
```

```
CC   tryptase b, PDE4 A, PDE4 B, PDE4 C, or PDE4 D. The oligonucleotides are
CC   useful for preventing or treating a respiratory or lung disease. The
CC   respiratory or lung disease is associated with hyper-responsiveness to
CC   and/or increased levels of, adenosine and/or levels of adenosine A
CC   receptor(s), and/or asthma and/or lung allergies associated with
CC   inflammation or an inflammatory disease. The respiratory or lung disease
CC   is chosen from airway inflammation, allergy, asthma, impeded respiration,
CC   cystic fibrosis (CF), chronic obstructive pulmonary disease (COPD),
CC   allergic rhinitis, acute respiratory distress syndrome, pulmonary
CC   hypertension, lung inflammation, bronchitis, airway obstruction or
CC   bronchoconstriction. This sequence represents an oligonucleotide of the
CC   invention.

PT   New amine-derivatised nucleoside(s) and oligo:nucleoside(s) - useful as
PT   diagnostics, therapeutics and research reagents, partic. in anti-sense
PT   therapy.
XX
PS   Example 44; Page 57; 117pp; English.
XX
CC   This sequence is generated to contain a 2'-O-hexylphthalimido functional
CC   group at the 5' end of the oligomer as opposed to a cholesterol or
CC   fluorescein functional group (see AAQ85818). This sequence is an analogue
CC   of an antisense sequence to the mse-ICAM. The modified nucleosides are
CC   used to increase the half-life of the oligomers in cell extract assays
CC   for the inhibition of specific genes. The modified oligomer is an example
CC   of a compound (see AAQ85799-Q85839 for other examples) e.g. a nucleoside
CC   or oligonucleoside, which contains a ribofuranosyl sugar portion and a
CC   base portion, such that at least one of the nucleoside contains at a 2'-O
CC   -, 3'-O- or 5'-O-position, a substitution (see AAQ85799 for details of
CC   the substitutions). The compounds are useful in diagnostics, therapeutics
CC   and as research reagents particularly in antisense therapy for killing
CC   cells and viruses such as HIV, herpes or papilloma viruses. (Updated on
CC   25-MAR-2003 to correct PN field.)

PT   GTPase gene family sequences derived from Campylobacter species - for use
PT   in the detection and differentiation of thermophilic and veterinary
PT   species of Campylobacter.
XX
PS   Claim 16; Page 39; 104pp; English.
XX
CC   The present sequence is a thermophilic Campylobacter c-gtp gene general
CC   probe. The c-gtp gene encodes a guanosine 5'-triphosphatase (GTPase)
CC   enzyme, or GTP-binding protein. The gene can be used in the prepn. of
CC   probes and primers, i.e. the present sequence, for the detection and
CC   differentiation of microorganisms in biological samples. Thermophilic and
CC   veterinary Campylobacter sp. can be detected with probes or primers
CC   derived from the c-gtp-1 and c-gtp-2 gene families, respectively.
CC   Thermophilic Campylobacter sp. include C. jejuni, C. coli, C. lari and C.
CC   upsaliensis, which are human pathogens involved in diarrhoea causing
CC   infections. Veterinary Campylobacter sp., encompass sp. which are
CC   important in veterinary infections, e.g. C. fetus, C. hyointestinalis and
CC   C. mucosalis

PT   Enriched cell complex with target cell component hybridised to detection
PT   agent - used to isolate specific cells from a mixed population, e.g.
PT   foetal cells from maternal blood for genetic abnormality analysis.
XX
PS   Example 2; Page 63; 91pp; English.
XX
CC   This primer FR4 is used for PCR amplification of a segment of
CC   immunoglobulin heavy chain (IgH) gene which is used as a genetic probe.
CC   This IgH genetic probe is specific for 5T33 myeloma cells. This is used
CC   in the formation of a novel enriched cell complex which comprises of a
CC   specific cell having a selected intracellular component to which a
CC   detection agent coupled to a solid support can hybridise to. The 5T33
CC   myeloma cells are enriched using an intracellular messenger RNA for the
CC   IgH gene followed by in situ hybridisation by the IgH genetic probe.
CC   Formation of a novel enriched complex is used to enrich cells from a
CC   mixed population, particularly as a preliminary to in situ hybridisation
CC   for quantification or detection of nucleic acid or proteins, e.g. for
CC   diagnosis or prognosis of diseases and infection, for characterisation of
CC   cell metabolism and differentiation and for therapeutic use. Typical
CC   applications are detecting foetal abnormalities (by enriching foetal
CC   cells from maternal blood), early diagnosis of cancer, screening for HIV
CC   or other infections, detecting predisposition to cancer, heart disease
CC   and, by detecting cancer cells in the circulation, assessing metastatic
CC   potential. The method can also be used to estimate the efficacy of
CC   therapy and for treatment of AIDS, leukaemia, blood-borne parasitic
CC   diseases by depleting affected cells

XX
PT   Genetic diagnosis of impulsive aggression - uses mutant forms of
PT   mono:amine oxidase enzyme.
XX
PS   Example 5; Column 29/30; 30pp; English.
XX
CC   The primers AAV27768-V27795 are used to amplify the fifteen monamine
CC   oxidase A (MAD) exons for SSCP analysis to detect mutations. A genetic
CC   defect linked to p11-p21 of the X chromosome, especially mutation C936T
CC   in exon 8 is related to abnormal behaviour. MAD metabolises serotonin,
CC   dopamine and noradrenaline, neurotransmitters whose metabolism is known
CC   to affect behaviour. Disregulation of these transmitters leads to
CC   borderline mental retardation and abnormal behaviour (including impulsive
CC   aggression). Probes based on the mutated sequence can be used for the
CC   genetic diagnosis of abnormal behaviour

PT   Preparation of antisense oligo:nucleotide(s) which lack long runs of
PT   consecutive guanosine or inosine - and have specific ratio of residues
PT   able to form two or three hydrogen bonds, have greater activity and
PT   reduced toxicity, used therapeutically or to modulate growth of cells in
PT   culture.
XX
PS   Claim 10; Fig 9a; 286pp; English.
XX
CC   AAV49008-236 represent antisense oligonucleotides directed against the rb
CC   gene. Of these, only oligonucleotides AAV49008-52 resulted in effective
CC   downregulation of negative growth control by rb, while oligonucleotides
CC   AAV49052-236 had little effect. The oligonucleotides exemplify the
CC   invention. The specification describes oligonucleotides that contain 8-30
CC   nucleotides, which contain at most 8 nucleotides that can each form three
CC   hydrogen bonds to cytosine; do not contain four consecutive nucleotides
CC   able to form three H-bonds each to four consecutive cytosines; do not
CC   contain two sequences of three consecutive nucleotides each able to form
CC   three H-bonds to three consecutive cytosines, and the ratio between
CC   residues able to form two H-bonds each (2R) or three such bonds (3R) is
CC   given by 2R/3R = 0.33-0.72. The oligonucleotides are used to modulate
CC   expression of genes, particularly the genes for p53, ErB-2, junB, junD,
CC   TGF-beta 1 or beta 2 to control proliferation of primary cell cultures
CC   (e.g. bone marrow stem, liver or kidney cells, osteoclasts, osteoblasts
CC   and/or keratinocytes). The oligonucleotides can also be used to analyse
CC   function of proteins (by altering their expression or activity) and
CC   therapeutically, e.g. in cases of cancer or (targeting TGF) for
CC   stimulating the immune system

XX
PT   Use of a prostate cancer associated gene and biallelic markers derived
PT   from it.
XX
PS   Claim 4; Page 357; 385pp; English.
XX
CC   The invention relates to a mammalian PG1 gene and protein, and a set of
CC   PG1 biallelic markers. The PG1 polynucleotide and biallelic markers are
CC   used in a hybridisation assay, a sequencing assay, or in an allele-
CC   specific amplification assay for determining the identity of a nucleotide
CC   at a PG1-related biallelic marker. The methods can be used to detect and
CC   to assess the risk of developing cancer or prostate cancer. Early-stage
CC   diagnosis of prostate cancer relies on prostate specific antigen (PSA)
CC   dosage. However, the effectiveness of this is limited due to its
CC   inability to discriminate between malignant and non-malignant affections
CC   of the organ. A need exists for both a reliable diagnostic procedure
CC   which would enable early-stage diagnosis, and for preventative and
CC   curative treatments of the disease. The PG1 gene can be used for
CC   detection of prostate cancer, and the risk of developing it in the
CC   future, and can also be used to determine therapies for the disease

PT Novel nucleic acid and polymorphic markers used for diagnosis of
PT diseases, especially those involving abnormal cell proliferation and
PT differentiation.
XX
PS Claim 15; Page 215; 223pp; English.
XX
CC This sequence represents a microsequencing primer for a biallelic marker
CC from the retinoblastoma binding protein-7 (RBP-7) genomic sequence
CC (AAZ86967) of the invention. The RBP-7 coding sequence and regulatory
CC sequences are useful for the recombinant production of the protein and
CC for expressing heterologous nucleic acids. Primers and probes derived
CC from the RBP-7 nucleotide sequence (such as this sequence) are useful for
CC DNA amplification and detection methods. RBP-7 biallelic markers (see
CC AAZ86993-Z87034) are useful for diagnosis of disease related to
CC alteration in the regulation or in the coding regions of the RBP-7 gene
CC and for prognosis/diagnosis of an eventual treatment with therapeutic
CC agents, especially agents acting on pathologies involving abnormal cell
CC proliferation and/or differentiation, these include thyroid hyperplasia,
CC psoriasis, benign prostate hypertrophy, cancers, including breast cancer,
CC sarcomas and other neoplasms, bladder cancer, colon cancer, lung cancer,
CC prostate cancer, various leukaemias, and lymphomas. RBP-7 antibodies are
CC useful as diagnostic agents

PT New hairpin and hammerhead ribozyme for inhibiting restenosis, cleaves
PT RNA encoding a cyclin or cell-cycle dependent kinase other than CDK1,
PT PCNA and Cyclin B1.
XX
PS Disclosure; Page 46; 109pp; English.
XX
CC The present invention relates to a hairpin or hammerhead ribozyme,
CC designed to cleave RNA encoding a cyclin or cell-cycle dependent kinase
CC other than cell-cycle dependent kinases CDK1, PCNA and Cyclin B1.
CC Representative examples of ribozyme recognition sites are given in
CC AAA82415 to AAA86787. The ribozyme of the invention is useful for
CC inhibiting restenosis by introduction of the ribozyme into cells. The
CC ribozyme is resistant to endonuclease activity and hence is efficient in
CC restenosis treatment

PT Treating proliferative skin or eye diseases and scarring, using ribozymes
PT that cleave RNA encoding cytokines involved in inflammation, matrix
PT metalloproteinases, growth factors and cell-cycle dependent kinases.
XX
PS Example 1; Page 243; 408pp; English.
XX
CC The present invention describes a method for treating a proliferative
CC skin or eye disease and scarring. The method involves administering a
CC ribozyme (I) which cleaves RNA encoding a cytokine involved in
CC inflammation, matrix metalloproteinase (MMP), cyclin, cell-cycle
CC dependent kinase, growth factor or a reductase, or administering a
CC nucleic acid molecule (II) comprising a promoter operably linked to a
CC nucleic acid segment encoding (I). (I) can have antipsoriatic,
CC dermatological, cytostatic, antiseborrheic, antidiabetic, antisickling,
CC ophthalmological, vulnerary, keratolytic and virucide activities, and
CC cleaves RNA encoding cytokine involved in inflammation. (I) can be used
CC in gene therapy. (I) and (II) are useful for treating proliferative skin
CC diseases such as psoriasis, atopic dermatitis, actinic keratosis,
CC squamous or basal cell carcinoma and viral or seborrheic wart. They can
CC also be used for treating proliferative eye diseases such as diabetic
CC retinopathy, vitreoretinopathy, sickle cell retinopathy, retinopathy of
CC prematurity and retinal detachment, and for treating and preventing
CC scarring such as keloid, adhesion and hypertrophic or hypertrophic burn
CC scar. AAH57577 to AAH62099 represent sequences used in the
CC exemplification of the present invention

PT   mismatch-containing DNA.
XX
PS   Example 3; Page 35; 71pp; English.
XX
CC   The invention relates to a method for genotyping or detecting mutation in
CC   DNA sample by candidate region mismatch scanning. The method involves
CC   amplifying candidate region of the DNA that includes 5' GATC 3' site,
CC   denaturing and reannealing the amplified DNA, digesting the reannealed
CC   DNA with the Escherichia coli mismatch detection enzymes, MutS, MutL and
CC   MutH, to cleave mismatch-containing DNA at 5' GATC 3' site and
CC   determining fraction of DNA cleaved. The invention also provides a method
CC   for determining allele-sharing status between sibs by candidate region
CC   mismatch scanning. The present sequence is a PCR primer used to amplify
CC   human CDKN1A promoter-5' UTR region. This primer is used in the
CC   exemplification of the invention

PT   New variants of calcium/calmodulin-dependent protein kinase-like nucleic
PT   acids and polypeptides, useful for diagnosing and treating
PT   neuropsychiatric disorders, e.g. schizophrenia, schizoaffective disorder,
PT   and bipolar disorder.
XX
PS   Claim 17; Page 99; 223pp; English.
XX
CC   The invention relates to a nucleic acid comprising a polymorphic region
CC   of a Calcium/Calmodulin-dependent protein kinase-like gene (CADPKL)
CC   allelic variant, and the polypeptide it encodes. CADPKL allelic variants
CC   are useful in determining whether a subject has or is at risk of
CC   developing a neuropsychiatric disorder, such as schizophrenia, attention
CC   deficit disorder (ADD), schizoaffective disorder, bipolar disorder,
CC   unipolar affective disorder and adolescent conduct disorder. The
CC   polypeptides, polynucleotides, antibodies and modulators of the CADPKL
CC   allelic variants are useful for diagnosing or treating these
CC   neuropsychiatric disorders. The polypeptides may be used to raise
CC   antibodies to a CADPKL polypeptide. The nucleic acids may be used as
CC   probes or primers, in pharmacogenomics for designing therapies for the
CC   disorders, and in fingerprinting for detection of different individuals
CC   with the same species (e.g. paternity testing). This sequence represents
CC   a PCR primer used to amplify human CADPKL DNA of the invention

PT   New double-stranded interfering nucleic acid, useful e.g. for treatment
PT   and diagnosis of cancer, downregulates the vascular endothelial growth
PT   factor receptor gene.
XX
PS   Example 3; SEQ ID NO 1165; 207pp; English.
XX
CC   The present invention describes a double-stranded short interfering
CC   nucleic acid (siNA) that downregulates expression of the vascular
CC   endothelial growth factor receptor (VEGFR) gene. Also described: (1) a
CC   siNA that downregulates the VEGF gene; (2) kits for in vitro or in vivo
CC   delivery of siNA; (3) conjugates and/or complexes of siNA; (4) vectors
CC   that express siNA; and (5) single-stranded siNA with similar properties.
CC   The siNAs have antiangiogenic, cytostatic, antidiabetic,
CC   ophthalmological, antiarthritic, antipsoriatic, nephrotropic and
CC   gynaecological activities. The siNA are useful for modulating
CC   (downregulating) the expression of VEGFR genes. The siNA are potentially
CC   useful for treating a wide range of angiogenesis-associated conditions,
CC   particularly cancers, diabetic retinopathy, macular degeneration,
CC   neovascular glaucoma, arthritis, psoriasis, endometriosis, angiofibroma,
CC   and polycystic kidney disease. The siNA may also be useful for diagnosis,
CC   drug screening, target identification and validation, genetic
CC   engineering, studying gene function, and also for gene mapping (e.g. of
CC   single-nucleotide polymorphisms). The present sequence is used in the
CC   exemplification of the present invention.

PT   Modulating the expression of a nucleic acid in the hepatic system, useful
PT   for treating hepatic disorders, comprises administering to the mammal an
PT   oligonucleotide that hybridizes to the nucleic acid to modulate its
PT   expression.
XX
PS   Example 7; SEQ ID NO 71; 98pp; English.
XX
CC   This invention relates to a novel method of modulating the expression of
CC   a nucleic acid in the hepatic system of a mammal which comprises
CC   administering to the mammal an oligonucleotide that hybridises to the
CC   nucleic acid to modulate the expression of the nucleic acid, where the
CC   oligonucleotide has two sterol groups that are covalently bonded. The
CC   invention may be useful for the development of a compound with
CC   hepatotropic activity whilst the genetic sequences of the invention may
CC   prove useful for gene therapy. The methods are useful for treating
CC   hepatic disease or disorder associated with a protein encoded by a gene.
CC   Note: These oligonucleotides may have one or more of several
CC   modifications which are detailed in the specification, including having a
CC   phosphorothioate backbone or having ribonucleoside bases.

PT   infection with human immune deficiency virus, comprises sugar-modified
PT   pyrimidine bases.
XX
PS   Example 3; SEQ ID NO 948; 170pp; English.
XX
CC   The invention relates to short interfering nucleic acids (siNA) which
CC   downregulate expression of HIV gene by RNA interference. The siNAs may or
CC   may not comprise ribonucleotides and may be double or single stranded.
CC   They further comprise sense and antisense regions, or alternatively are
CC   assembled from a sense oligonucleotide and an antisense oligonucleotide.
CC   Specifically, the siNAs include short interfering RNA (siRNA), double-
CC   stranded RNA, micro-RNA (miRNA) and short hairpin RNA (shRNA). The siNAs
CC   can be unmodified or chemically modified, can contain
CC   deoxyribonucleotides, and can be chemically synthesised, expressed from a
CC   vector or enzymatically synthesised. The invention also relates to kits
CC   for the in vitro or in vivo delivery of siNA; conjugates and/or complexes
CC   of siNA; and vectors that express siNA. The siNAs are used to modulate
CC   expression of the HIV gene in cells, tissue explants or organisms (e.g.,
CC   by ex vivo gene therapy), or in grafts and transplants for the treatment
CC   of a variety of conditions. HIV siNAs have anti-HIV activity. They may be
```

```
CC   used for inhibiting replication of HIV and may be used to treat HIV
CC   infection. The siNAs are also useful for drug screening, diagnosis,
CC   therapeutic target identification and validation, genetic engineering,
CC   pharmacogenomics, studying gene function, and gene mapping (e.g., of
CC   single nucleotide polymorphisms). The present sequence represents the
CC   lower strand of an HIV-targeted double-stranded siNA.

PS Example 7; SEQ ID NO 1119; 197pp; English.
XX
CC The invention relates to a novel double-stranded short interfering
CC nucleic acid (siNA) that downregulates expression of the breakpoint
CC cluster region-v-abl Abelson murine leukaemia viral oncogene homologue 1
CC (BCR-ABL) gene. The siRNA of the invention demonstrates cytostatic
CC activity and may be useful for modulating expression of the BCR-ABL gene,
CC as well as for treating leukaemia or lymphoma and in diagnosis, drug
CC screening, target identification and validation, genetic engineering,
CC gene function studies and gene mapping. The current sequence is that of
CC the human ABL1-targeted siRNA of the invention.

PT New transgenic non-human animal expressing a foreign polypeptide
PT associated with drug behavior and/or metabolism, useful for studying the
PT behavior and/or metabolism of a drug in other animals.
XX
PS Example 2A; Page 54; 408pp; English.
XX
CC This invention relates to a transgenic non-human animal which may be used
CC for assessing the behaviour and/or metabolism of a drug in another animal
CC and which expresses a foreign polypeptide associated with drug behaviour
CC and/or metabolism. The invention also comprises a nucleic acid construct
CC for use in producing the above transgenic non-human animal and a method
CC of assessing the metabolism and/or behavior of a drug in an animal of
CC interest, comprising administering a test agent to the transgenic animal
CC and conducting analytical tests to determine drug metabolism and/or
CC behaviour. The transgenic animal is useful in studying drug metabolism
CC and/or behaviour in other animals. The nucleic acid construct is useful
CC in producing the above transgenic animal and the methods are used for
CC producing, breeding and using transgenic animals for pharmacological
CC (e.g. pharmacokinetic or pharmacodynamic assays) and/or toxicological
CC studies. Nucleic acid sequences used within the invention are serum
CC albumin; alpha-acidic glycoprotein; cytochrome P450 (CYP); uridine

```

PT   Receptors for bombesin-like peptide(s) and their DNA - useful for
PT   screening for agonists and antagonists of the receptor ligands, also for
PT   treating or diagnosing cancer.
XX
PS   Example 12; Page 85-91; 173pp; English.
XX
CC   The primers of AAQ36431-32 were used in the identification of cDNA clone
CC   encoding the Swiss 3T3 GRP Receptor. EXT 3 (AAQ36431) was used as a gene-
CC   specific primer for reverse transcription of Swiss 3T3 mRNA, and EXT 2
CC   (AAQ36432) was used as a gene specific primer for Taq DNA polymerase
CC   catalysed PCR. The DNA sequences encoding mouse R1BP; human R1BP; rat
CC   R2BP; human R2BP and human R3BP are given in AAQ29158-62 respectively.
CC   The receptor gene and encoded polypeptide are used for screening for
CC   agonists and antagonists of the receptor ligands, for producing
CC   diagnostic or therapeutic reagents, and for producing antibodies. Hosts
CC   suffering from abnormal receptor function, e.g. proliferative cell
CC   conditions such as cancers, may be treated. The mouse GRP receptor was
CC   isolated from Swiss 3T3 fibroblasts and sequenced. The sequence was used
CC   to design oligonucleotide probes to isolate DNA encoding mouse GRP
CC   receptor from a Swiss 3T3 cDNA library. This DNA was then used as a probe
CC   to isolate rat NMB receptor, human GRP receptor, human NMB receptor and
CC   human R3BP (incompletely characterised homologous putative receptor) from
CC   DNA libraries. (Updated on 25-MAR-2003 to correct PN field.)

PT   Enzymatic nucleic acids - which cleave RNA derived from an epidermal
PT   growth factor receptor, useful for inhibiting cell proliferation and for
PT   treating cancers.
XX
PS   Claim 5; Page 83; 109pp; English.
XX
CC   The present invention describes enzymatic nucleic acid molecules (NAMs)
CC   which specifically cleave RNA derived from an epidermal growth factor
CC   receptor (EGF-R) gene. AAV97221 to AAV98043 and AAV98979 to AAV99090
CC   represent specifically claimed target sequence from human EGF-R. AAV98044
CC   to AAV98866 and AAV98867 to V9878 represent hammerhead ribozymes and
CC   hairpin ribozymes respectively for human EGF-R. The NAMs are useful for
```

```
CC   cleaving EGF-R RNA in the treatment of a condition associated with EGFR
CC   expression levels e.g. to inhibit cell proliferation in the prevention or
CC   treatment of cancers. The NAMs can also be used as diagnostic tools to
CC   examine genetic drift and mutations within diseased cells or to detect
CC   the presence of EGF-R RNA in a cell

PT   Novel ribozymes for modulating the synthesis, expression and/or stability
PT   of an mRNA encoding an angiogenic factors.
XX
PS   Claim 54; Page 258; 305pp; English.
XX
CC   The present invention describes enzymatic nucleic acid molecules with RNA
CC   cleaving activity, which specifically cleave RNA encoded by an aryl
CC   hydrocarbon nuclear transporter (ARNT) gene, an integrin subunit beta 3
CC   gene, an integrin alpha 6 subunit gene, or a Tie-2 gene. AAA16775 to
CC   AAA17167 and AAA17561 to AAA17622 represent ribozyme sequences for ARNT,
CC   and AAA17168 to AAA17560 and AAA17623 to AAA17684 represent their
CC   corresponding target sequences; AAA17685 to AAA18385 and AAA19087 to
CC   AAA19154 represent ribozyme sequences for Tie-2, and AAA18386 to AAA19086
CC   and AAA19155 to AAA19222 represent their corresponding target sequences;
CC   AAA19223 to AAA20361 and AAA21501 to AAA21595 represent ribozyme
CC   sequences for integrin alpha 6 subunit, and AAA20362 to AAA21500 and
CC   AAA21596 to AAA21688 represent their corresponding target sequences;
CC   AAA21689 to AAA22475 and AAA23263 to AAA23342 represent ribozyme sequence
CC   for integrin subunit beta 3, and AAA22476 to AAA23262, AAA23343 to
CC   AAA23422 represent their corresponding target sequences. The ribozymes of
CC   the invention are used for modulating the synthesis, expression and/or
CC   stability of an mRNA encoding angiogenic factor, especially ARNT,
CC   integrin subunit beta-3, integrin subunit alpha-6, or Tie-2. They are
CC   especially used to treat cancer, diabetic retinopathy, age related
CC   macular degeneration (ARMD), inflammation, and arthritis, as well as
CC   neovascular glaucoma, myopic degeneration, psoriasis, verruca vulgaris,
CC   angiofibroma of tuberous sclerosis, pot-wine stains, Sturge Weber
CC   syndrome, Kippel-Trenaunay-Weber syndrome, Osler-Weber-Rendu syndrome,
CC   and other syndromes and diseases related to the levels of ARNT, Tie-2,
CC   integrin subunit alpha-6, or integrin subunit beta-3

PT   Identifying new catalytic nucleic acid that modulates selected processes
PT   - especially ribozymes that cleave Raf RNA for treating cancer,
PT   restenosis, and also new ribozymes and modified nucleoside triphosphates
PT   used as antiviral agents and synthons.
XX
PS   Claim 177; Page 152; 259pp; English.
XX
CC   A method has been developed for the identification of a nucleic acid
CC   capable of modulating a process in a biological system. The method
CC   comprises: (a) introducing into the system a random library of nucleic
CC   acid catalysts (NAC) having a substrate binding domain (SBD), comprising
CC   a random sequence, and a catalytic domain (CD); and (b) identifying NAC
CC   in systems where modulation has occurred and/or determining the sequence
CC   of at least part of the SBDs in such systems. Nucleic acid molecules with
CC   endonuclease activity and catalytic activity, from the present invention,
CC   are used to modulate gene expression in plant and mammalian cells and to
CC   cleave target nucleic acid, particularly for treating systemic diseases
CC   caused by specific RNA, e.g. cancer, inflammation, psoriasis, non-hepatic
CC   ascites and infection. They may also be used to detect genetic drift and
CC   mutations in diseased cells and to determine c-raf RNA. Specifically NACs
CC   with RNA-cleaving activity that modulate expression of the Raf gene, are
CC   used to treat cancer, restenosis, psoriasis or rheumatoid arthritis, or
CC   generally any condition associated with the level of c-raf. Introduction
CC   of sugar/phosphate modifications increases stability against nuclease and
CC   activity. AAV90922 to AAV93877 represent NACs that can be used in the
CC   method, specifically for modulating the expression of a Raf gene

PT   New nucleic acids that interact, and optionally cleave, target sequences,
PT   used to treat cancer.
XX
PS   Claim 77; Page 77; 148pp; English.
XX
CC   The present invention describes nucleic acids (A) that interact stably
CC   with a target sequence and contain at least one phosphoro(di)thioate
CC   link, having endonuclease activity. (A), and more generally any catalytic
CC   nucleic acid (A') that modulates expression of the oestrogen receptor
CC   gene, are used to treat cancer (particularly of breast or endometrium),
CC   in vivo or by transforming cells ex vivo and implanting treated cells, or
CC   for other conditions associated with levels of oestrogen receptor.
CC   Because of the high selectivity for targeted RNA, (A) can also be used to
CC   correlate inhibition of gene expression with alterations in phenotype,
CC   particularly for identification of therapeutic targets, and as research
CC   reagents (for RNA, in the same way that restriction endonucleases are
CC   used with DNA). The combination of modifications in (A) improves
CC   resistance to nucleases, binding affinity and/or activity. AAA23503 to
CC   AAA24747 represent oestrogen receptor hammerhead ribozyme sequences, and
CC   AAA24748 to AAA25992 represent their corresponding target sequences.
CC   AAA25993 to AAA26105 represent oestrogen receptor hairpin ribozyme
CC   sequences, and AAA26107 to AAA26218 represent their corresponding target
CC   sequences. AAA26219 to AAA26271 represent other ribozyme sequences and
CC   antisense oligonucleotides used in the exemplification of the present
CC   invention

PT   Nucleic acid selected from one of 106 genes comprising single nucleotide
PT   polymorphisms, allele-specific oligonucleotides to the genes are useful
PT   for phenotypic correlations, forensics, paternity testing, medicine and
PT   genetic analysis.
XX
PS   Claim 8; Fig 5; 214pp; English.
XX
CC   The present invention is concerned with a number of human single
CC   nucleotide polymorphisms (SNPs) which the inventors identified in human
CC   genes. These SNPs can be used in disease diagnosis and prediction of an
CC   individual's susceptibility to disease, in forensic and paternity testing
CC   and in genetic mapping. In particular, the SNPs of the invention can be
CC   used to diagnose susceptibility to diseases of the cardiovascular,
CC   endocrine and neurological systems, such as coronary artery disease,
CC   schizophrenia, cancer, autoimmune diseases, Alzheimer's and Parkinson's
CC   diseases

XX
CC This invention describes a novel method for the targeted non-ribosomal
CC synthesis of peptides (I) of required structure, comprising altering one
CC or more A (adenylation) domain-encoding DNA segments (II) that encodes a
CC non-ribosomal peptide synthetase so that the expression product of the
CC altered (II) can produce (I), is new. Alterations in the A-domains are

```
CC   made according to a non-ribosomal code reproduced in the specification.
CC   The method is used to synthesize (I) with antibiotic, immunosuppressant,
CC   cytostatic, antiviral, antihelminthic, fungicidal or surface-active
CC   properties, and to alter specificity and/or activity of known
CC   biologically active compounds, e.g. to improve their solubility by
CC   replacing hydrophobic amino acids with hydrophilic ones, or vice versa.
CC   AAA97960-A97995 represent PCR primers used to illustrate the method of
CC   the invention. (Updated on 15-SEP-2003 to standardise OS field)

PT   growth inhibitor gene useful for treating, e.g., lymphoma, leukemia, and
PT   central nervous system injury.
XX
PS   Claim 30; Page 148; 200pp; English.
XX
CC   The invention relates to a nucleic acid molecule which down regulates
CC   expression of a CD20 gene and a nucleic acid molecule which down
CC   regulates expression of a neurite growth inhibitor gene (NOGO). The
CC   nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a
CC   DNAzyme) an Inozyme (an endolytic nucleic acid cleaving a an RNA molecule
CC   possessing an NCH motif), a G-cleaver (cleaving RNA with a NYN motif) pr
CC   an amberzyme (cleaving RNA with an NGN triplet), a zinzyme (cleaving RNA
CC   with a YGY motif). The CD20-targetting nucleic acid is used to cleave RNA
CC   of CD20 in the presence of a divalent cation that is preferably Mg^2^+.
CC   Furthermore, it may be contacted with a cell to reduce CD20 activity of
CC   the cell and treat a patient having a condition associated with the level
CC   of CD20. The treatment may further comprise the use of one or more
CC   therapies. In particular, the CD20 targetting nucleic acid may be used to
CC   treat lymphoma, leukaemia, B-cell lymphoma, low-grade or follicular non-
CC   Hodgkin's lymphoma (NHL), bulky low-grade or follicular NHL, lymphocytic
CC   leukaemia, HIV (human immunodeficiency virus) associated NHL, mantle-cell
CC   lymphoma (MCL), immunocytoma (IMC), small B-cell lymphocytic lymphoma,
CC   immune thrombocytopaenia, and inflammatory arthropathy. The NOGO-
CC   targetting nucleic acid is used to cleave RNA of the NOGO gene in the
CC   presence of a divalent cation that is preferably Mg^2^+. Furthermore, the
```

```
CC   nucleic acid may be contacted with a cell to reduce NOGO activity of the
CC   cell and treat a patient having a condition associated with the level of
CC   NOGO. The treatment may further comprise the use of one or more
CC   therapies. In particular, the NOGO-targetting nucleic acid may be used to
CC   treat central nervous system (CNS) injury and cerebrovascular accident
CC   (CVA, stroke), Alzheimer's disease, dementia, multiple sclerosis (MS),
CC   chemotherapy-induced neuropathy, amyotrophic lateral sclerosis (ALS),
CC   Parkinson's disease, ataxia, Huntington's disease, Creutzfeldt-Jakob
CC   disease, muscular dystrophy, and/or other neurodegenerative disease
CC   states which respond to the modulation of NOGO expression. The present
CC   sequence is an inozyme of the invention

PT   Nucleic acid molecules, e.g., enzymatic nucleic acids and antisense
PT   constructs, which down regulate expression of a CD20 gene or neurite
PT   growth inhibitor gene useful for treating, e.g., lymphoma, leukemia, and
PT   central nervous system injury.
XX
PS   Claim 88; Page 79; 200pp; English.
XX
CC   The invention relates to a nucleic acid molecule which down regulates
CC   expression of a CD20 gene and a nucleic acid molecule which down
CC   regulates expression of a neurite growth inhibitor gene (NOGO). The
CC   nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a
CC   DNAzyme) an Inozyme (an endolytic nucleic acid cleaving a an RNA molecule
CC   possessing an NCH motif), a G-cleaver (cleaving RNA with a NYN motif) pr
CC   an amberzyme (cleaving RNA with an NGN triplet), a zinzyme (cleaving RNA
CC   with a YGY motif). The CD20-targetting nucleic acid is used to cleave RNA
CC   of CD20 in the presence of a divalent cation that is preferably Mg^2^+.
CC   Furthermore, it may be contacted with a cell to reduce CD20 activity of
CC   the cell and treat a patient having a condition associated with the level
CC   of CD20. The treatment may further comprise the use of one or more
CC   therapies. In particular, the CD20 targetting nucleic acid may be used to
CC   treat lymphoma, leukaemia, B-cell lymphoma, low-grade or follicular non-
CC   Hodgkin's lymphoma (NHL), bulky low-grade or follicular NHL, lymphocytic
CC   leukaemia, HIV (human immunodeficiency virus) associated NHL, mantle-cell
CC   lymphoma (MCL), immunocytoma (IMC), small B-cell lymphocytic lymphoma,
CC   immune thrombocytopaenia, and inflammatory arthropathy. The NOGO-
CC   targetting nucleic acid is used to cleave RNA of the NOGO gene in the
CC   presence of a divalent cation that is preferably Mg^2^+. Furthermore, the
CC   nucleic acid may be contacted with a cell to reduce NOGO activity of the
CC   cell and treat a patient having a condition associated with the level of
CC   NOGO. The treatment may further comprise the use of one or more
CC   therapies. In particular, the NOGO-targetting nucleic acid may be used to
CC   treat central nervous system (CNS) injury and cerebrovascular accident
CC   (CVA, stroke), Alzheimer's disease, dementia, multiple sclerosis (MS),
CC   chemotherapy-induced neuropathy, amyotrophic lateral sclerosis (ALS),
CC   Parkinson's disease, ataxia, Huntington's disease, Creutzfeldt-Jakob
CC   disease, muscular dystrophy, and/or other neurodegenerative disease
CC   states which respond to the modulation of NOGO expression. The present
CC   sequence is an inozyme of the invention

PT   New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins,
PT   or as specific biomolecule capture probes for surface-enhanced laser
PT   desorption ionization, comprises human myosin-like protein hGDMLP-1.
XX
PS   Disclosure; SEQ ID NO 2784; 214pp; English.
XX
CC   The present invention describes a human genome-derived myosin-like
CC   protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-
CC   1 can be used in gene therapy and vaccine production. The hGDMLP-1
CC   nucleic acids can be used as probes to detect, characterise and quantify
CC   hGDMLP-1 nucleic acids in samples, as amplification substrates, to
CC   provide initial substrates for the recombinant engineering of hGDMLP-1
CC   protein variants having desired phenotypic improvements, and for
CC   expressing the proteins. The hGDMLP-1 proteins or polypeptides may be
CC   used as immunogens to raise antibodies that specifically recognise hGDMLP
CC   -1 proteins, as standards in assays used to determine the concentration
CC   and/or amount specifically of hGDMLP proteins, as specific biomolecule
CC   capture probes for surface-enhanced laser desorption ionisation, as
CC   therapeutic supplement in patients having specific deficiency in hGDMLP-1
CC   production, and in vaccines or for replacement therapy. The
CC   polynucleotide sequences encoding hGDMLP-1 may be used for diagnosing a
CC   disorder associated with the expression of hGDMLP-1, in particular heart
CC   and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22.
CC   The present sequence represents an oligomer used in the screening of the
CC   hGDMLP-1 sequence in the exemplification of the present invention. N.B.
CC   The sequence data for this patent did not form part of the printed
CC   specification, but was obtained in electronic format directly from WIPO

CC   The present invention describes a human genome-derived myosin-like
CC   protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-
CC   1 can be used in gene therapy and vaccine production. The hGDMLP-1
CC   nucleic acids can be used as probes to detect, characterise and quantify
CC   hGDMLP-1 nucleic acids in samples, as amplification substrates, to
CC   provide initial substrates for the recombinant engineering of hGDMLP-1
CC   protein variants having desired phenotypic improvements, and for
CC   expressing the proteins. The hGDMLP-1 proteins or polypeptides may be
CC   used as immunogens to raise antibodies that specifically recognise hGDMLP
CC   -1 proteins, as standards in assays used to determine the concentration
CC   and/or amount specifically of hGDMLP proteins, as specific biomolecule
CC   capture probes for surface-enhanced laser desorption ionisation, as
CC   therapeutic supplement in patients having specific deficiency in hGDMLP-1
CC   production, and in vaccines or for replacement therapy. The
CC   polynucleotide sequences encoding hGDMLP-1 may be used for diagnosing a
CC   disorder associated with the expression of hGDMLP-1, in particular heart
CC   and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22.
CC   The present sequence represents an oligomer used in the screening of the
CC   hGDMLP-1 sequence in the exemplification of the present invention. N.B.
CC   The sequence data for this patent did not form part of the printed
CC   specification, but was obtained in electronic format directly from WIPO
CC   at ftp.wipo.int/pub/published_pct_sequence

PT   for treating subjects having defects in HTPL.
XX
PS   Example 2; Page 216; 718pp; English.
XX
CC   The present invention relates to human testis expressed Patched like
CC   protein (HTPL, see ABV78759 to ABV78762 and ABB98519 to ABB98520). HTPL
CC   has two isoforms, with a few single base pair differences between the
CC   two. One of the single base pair changes introduces a premature stop
CC   codon in HTPL-S (S for short) compared to HTPL-L (L for long). HTPL
CC   shares an overall structure organisation with the Patched protein. The
CC   shared structural features strongly imply that HTPL plays a role similar
CC   to that of Patched, and is a potential tumour suppressor. HTPL is
CC   important in regulating male germ cell development, and the HTPL gene was
```

CC mapped to human chromosome 10p12.1. HTPL and its coding sequence are
CC useful for diagnosing a disorder caused by mutation in HTPL, and in
CC therapy and manufacture of a medicament for treatment or prevention of
CC such disorder associated with decreased expression or activity of human
CC HTPL. Such disorders include disorders of testis, or adrenal, adult and
CC foetal liver, bone marrow, brain, kidney, lung, placenta, prostate,
CC skeletal muscle or colon function. HTPL proteins and nucleic acids are
CC clinically useful diagnostic markers and potenial therapeutic agents for
CC male infertility and cancer. The present oligonucleotide was used in an
CC example from the invention

XX
CC The present invention relates to methods and compositions useful for
CC detecting mutations which cause Familial Dysautonomia (FD, Riley-Day
CC syndrome, Hereditary Sensory and Autonomic Neuropathy Type III) [OMIM
CC 223900]. It was found that mutations in the IKBKAP gene (see ABQ80565)
CC are associated with FD. The mutation associated with the major haplotype
CC of FD, FD1 mutation, is a base pair (bp) mutation, where the thymine
CC nucleotide located at bp 6 of intron 20 in the IKBKAP gene is replaced
CC with a cytosine. This results in skipping of exon 20 in the mRNA from FD
CC patients, although they continue to express varying levels of wild-type
CC message in a tissue-specific manner. The mutation associated with the
CC minor haplotype, FD2 mutation, is a bp mutation, where the guanine
CC nucleotide at bp 2397 (bp 73 of exon 19) is replaced with a cytosine.
CC This bp mutation causes an arginine to proline missense mutation (R696P)

CC in the IKBKAP protein, which is predicted to disrupt a potential
CC phosphorylation site. The IKBKAP nucleic acid sequences are useful for
CC identifying a subject with FD and for rapid carrier screening. The IKBKAP
CC gene maps to chromosome 9q31. A mouse model of FD was created in an
CC example from the invention. Expression of murine Ikbkap was examined
CC using both mouse embryo and adult mouse multiple tissue Northern blots.
CC The blots were probes with a 1045bp PCR fragent that contains exons 2
CC through 11, which was generated using PCR primers ABQ80563-ABQ80564.
CC ABQ99662-ABQ99733 are the murine Ikbkap exon and intron boundaries

PT useful for treating cancer, diabetic retinopathy, macular degeneration,
PT arthritis, psoriasis, verruca vulgaris and Sturge Weber syndrome.
XX
PS Claim 4; Page 64; 149pp; English.
XX
CC The invention relates to a nucleic acid molecule (I) which down regulates
CC expression of an Ets-related gene (ERG). (I) is useful for treating
CC conditions selected from cancer, lymphoma, Ewing's sarcoma, melanoma,
CC tumour angiogenesis, diabetic retinopathy, macular degeneration,
CC neovascular glaucoma, myopic degeneration, arthritis, psoriasis, verruca
CC vulgaris, angiofibroma of tuberous sclerosis, port-wine stains, Sturge
CC Weber syndrome, Kippel-Trenaunay-Weber syndrome, Osler-Weber-rendu
CC syndrome, leukaemia, osteoporosis and wound healing. (I) is useful for
CC treating a patient having a condition associated with the level of ERG,
CC by contacting cells of the patient with (I) under conditions suitable for
CC the treatment. The method comprises the use of one or more therapies
CC under conditions suitable for the treatment. Leukaemia or tumour
CC angiogenesis is treated by administering (I) to the patient in
CC conjunction with one or more of other therapies such as radiation or
CC chemotherapy treatment. (I) is useful for reducing ERG activity in a
CC cell, by contacting the cell with (I). (I) is useful for cleaving RNA of
CC ERG gene, by contacting (I) with RNA, in the presence of a divalent
CC cation such as Mg2+. (I) is useful for diagnosis of conditions and
CC diseases related to the expression of ERG, and as diagnostic tool to
CC examine genetic drift and mutations within diseased cells or to detect
CC the presence of ERG RNA in a cell. (I) is useful for specifically
CC targeting genes that share homology with ERG gene or ERG fusion genes.
CC ABK17354-ABK22719 represent nucleic acids, including antisense and
CC enzymatic nucleic acid molecules which regulate expression of ERG, and
CC related PCR primers of the invention

XX
PS Example 2; SEQ ID NO 1931; 60pp + Sequence Listing; English.
XX

```
CC   The invention relates to an isolated SH3 domain (POSH)-like signalling
CC   protein 1 (POSHL 1) polypeptide (I), comprising a sequence of 730 amino
CC   acids (S1, ABB83999), a sequence having 65% sequence identity to (S1),
CC   (S1) having 95% deviations, especially conservative substitutions or a
CC   fragment of the sequences comprising at least 8 contiguous amino acids.
CC   Human POSHL 1 is a proto-oncogene/oncogene product that functions as an
CC   adaptor protein that interacts with Rho family small GTPases as well as
CC   downstream components of the signal transduction pathway. (I) is useful
CC   for identifying a specific binding partner. (I) and nucleic acids (II)
CC   encoding (I) are useful for diagnosing, monitoring disease and treating
CC   caused by altered expression of human POSHL1 including diagnosing and
CC   treating cancer, they useful in the development of vaccines and (II) is
CC   useful in gene therapy. (II) is useful for constructing microarrays which
CC   are useful for measuring and for surveying gene expression and creating
CC   transgenic non-human animals capable of producing the proteins. The
CC   present sequence is that of a scanning oligonucleotide useful in examples
CC   of the invention. Note: The present sequence did not form part of the
CC   printed specification, but is based on sequence information supplied to
CC   Derwent by the European Patent Office

XX
CC The invention relates to enzymatic nucleic acid molecules that down
CC regulate expression of chloride channel calcium activated 1 (CLCA1) genes
CC by cleaving RNA derived from the genes. The nucleic acid sequences are
CC useful as pharmaceutical agents for treating conditions such as chronic
CC obstructive pulmonary disease (COPD), chronic bronchitis, asthma, cystic
CC fibrosis, obstructive bowel syndrome and any other diseases or conditions
CC that are related to or will respond to the levels of CLCA1 in a cell or
CC tissue. The sequences are useful for reducing CLCA1 activity in a cell,
CC hence, are useful for treatment of a patient having a condition
CC associated with the level of CLCA1, where the invention further comprises
CC the use of one or more therapies under conditions suitable for the
CC treatment, for example, oxygen therapy, bronchodilators, corticosteroids,
CC antibacterials, vaccinations, acetylcysteine and mucokinetic agents. The
CC nucleic acids of the invention are also used as diagnostic tools to
CC examine genetic drift and mutations within diseased cells or to detect
CC the presence of CLCA1 RNA in a cell. This sequence represents an
CC enzymatic nucleic acid molecule of the invention

PT   New nucleic acid molecule that modulates replication of West Nile Virus
PT   (WNV), useful for treating a condition related to WNV infection e.g.
PT   pancreatitis, meningitis, hepatocellular carcinoma or cirrhosis.
XX
PS   Claim 23; SEQ ID NO 7096; 495pp; English.
XX
CC   The invention relates to nucleic acid molecules that modulate replication
CC   of the West Nile Virus (WNV). The nucleic acid molecules are useful for
CC   treating a condition related to WNV infection e.g. pancreatitis,
CC   encephalitis, myocarditis, meningitis, neurologic infection, hepatitis,
CC   liver failure, hepatocellular carcinoma or cirrhosis. The nucleic acid
CC   molecule is selected from the group of ribozymes consisting of
CC   Hammerhead, Inozyme, G-cleaver, DNAzyme, Amberzyme and Zinzyme. The
CC   nucleic acid molecules further comprise at least five ribose residues, at
CC   least ten 2'-O-methyl modifications, phosphorothioate linkages on at
CC   least three of the 5' terminal nucleotides and a 3' end modification of a
CC   3'-3' inverted abasic moiety. Nucleic acid molecules SEQ ID NO 1 to 37080
CC   are claimed; however, SEQ ID NO 2194-2206 and 17502-17514 are not given
CC   in the specification. The present sequence is that of a nucleic acid
CC   molecule of the invention

PT   pancreatitis, meningitis, hepatocellular carcinoma or cirrhosis.
XX
PS   Claim 23; SEQ ID NO 8706; 495pp; English.
XX
CC   The invention relates to nucleic acid molecules that modulate replication
CC   of the West Nile Virus (WNV). The nucleic acid molecules are useful for
CC   treating a condition related to WNV infection e.g. pancreatitis,
CC   encephalitis, myocarditis, meningitis, neurologic infection, hepatitis,
CC   liver failure, hepatocellular carcinoma or cirrhosis. The nucleic acid
CC   molecule is selected from the group of ribozymes consisting of
CC   Hammerhead, Inozyme, G-cleaver, DNAzyme, Amberzyme and Zinzyme. The
CC   nucleic acid molecules further comprise at least five ribose residues, at
CC   least ten 2'-O-methyl modifications, phosphorothioate linkages on at
CC   least three of the 5' terminal nucleotides and a 3' end modification of a
CC   3'-3' inverted abasic moiety. Nucleic acid molecules SEQ ID NO 1 to 37080
CC   are claimed; however, SEQ ID NO 2194-2206 and 17502-17514 are not given
CC   in the specification. The present sequence is that of a nucleic acid
CC   molecule of the invention

PT   pancreatitis, meningitis, hepatocellular carcinoma or cirrhosis.
XX
PS   Claim 23; SEQ ID NO 3127; 495pp; English.
XX
CC   The invention relates to nucleic acid molecules that modulate replication
CC   of the West Nile Virus (WNV). The nucleic acid molecules are useful for
CC   treating a condition related to WNV infection e.g. pancreatitis,
CC   encephalitis, myocarditis, meningitis, neurologic infection, hepatitis,
CC   liver failure, hepatocellular carcinoma or cirrhosis. The nucleic acid
CC   molecule is selected from the group of ribozymes consisting of
CC   Hammerhead, Inozyme, G-cleaver, DNAzyme, Amberzyme and Zinzyme. The
CC   nucleic acid molecules further comprise at least five ribose residues, at
CC   least ten 2'-O-methyl modifications, phosphorothioate linkages on at
CC   least three of the 5' terminal nucleotides and a 3' end modification of a
CC   3'-3' inverted abasic moiety. Nucleic acid molecules SEQ ID NO 1 to 37080
CC   are claimed; however, SEQ ID NO 2194-2206 and 17502-17514 are not given
CC   in the specification. The present sequence is that of a nucleic acid

PT New isolated nucleic acid, useful for treating viral diseases associated
PT with tumors and cell degeneration, also related polypeptides, antibodies
PT and transfected cells.
XX
PS Disclosure; Page 478; 720pp; French.
XX
CC The invention relates to a novel isolated 17 mer nucleic acid sequence,
CC given in the specification, a sequence containing at least 15 consecutive
CC nucleotides from the 17 mer sequence, a sequence with, after optimal
CC alignment, at least 80 % identity to the 17 mer sequence, a sequence that
CC hybridizes to them under highly stringent conditions, or the complement
CC of any of them, or the corresponding RNA. The novel isolated nucleic
CC acids of the invention are useful as probes and primers for detecting,
CC identifying, quantifying and/or amplifying a nucleic acid, e.g. as one
CC component of a gene chip, in vitro as (anti)sense reagents, and for
CC production of recombinant polypeptides. Any of the nucleic acids,
CC polypeptides, vectors containing the nucleic acids, cells containing the
CC vector or antibodies directed against the polypeptides are useful for
CC preparation of pharmaceuticals for prevention and/or treatment of viral
CC diseases that are characterised by development of tumours or cell
CC degeneration, specifically cancer but also Alzheimer's disease and
CC schizophrenia. Analysis of the expression of the 17 mer nucleic acids in
CC patient samples is useful for diagnosis and/or prognosis of these
CC diseases. The polypeptides can also be used to generate antibodies, and
CC both the polypeptide and antibodies are useful as components of protein
CC chips. The nucleic acid sequences of the invention can be used in gene

XX
CC The invention relates to a novel isolated 17 mer nucleic acid sequence,
CC given in the specification, a sequence containing at least 15 consecutive
CC nucleotides from the 17 mer sequence, a sequence with, after optimal
CC alignment, at least 80 % identity to the 17 mer sequence, a sequence that
CC hybridizes to them under highly stringent conditions, or the complement
CC of any of them, or the corresponding RNA. The novel isolated nucleic
CC acids of the invention are useful as probes and primers for detecting,
CC identifying, quantifying and/or amplifying a nucleic acid, e.g. as one
CC component of a gene chip, in vitro as (anti)sense reagents, and for
CC production of recombinant polypeptides. Any of the nucleic acids,
CC polypeptides, vectors containing the nucleic acids, cells containing the
CC vector or antibodies directed against the polypeptides are useful for
CC preparation of pharmaceuticals for prevention and/or treatment of viral
CC diseases that are characterised by development of tumours or cell
CC degeneration, specifically cancer but also Alzheimer's disease and
CC schizophrenia. Analysis of the expression of the 17 mer nucleic acids in
CC patient samples is useful for diagnosis and/or prognosis of these

```
CC   diseases. The polypeptides can also be used to generate antibodies, and
CC   both the polypeptide and antibodies are useful as components of protein
CC   chips. The nucleic acid sequences of the invention can be used in gene
CC   therapy. This polynucleotide sequence represents a tumour suppression
CC   related human fukutin oligonucleotide of the invention

CC acids of the invention are useful as probes and primers for detecting,
CC identifying, quantifying and/or amplifying a nucleic acid, e.g. as one
CC component of a gene chip, in vitro as (anti)sense reagents, and for
CC production of recombinant polypeptides. Any of the nucleic acids,
CC polypeptides, vectors containing the nucleic acids, cells containing the
CC vector or antibodies directed against the polypeptides are useful for
CC preparation of pharmaceuticals for prevention and/or treatment of viral
CC diseases that are characterised by development of tumours or cell
CC degeneration, specifically cancer but also Alzheimer's disease and
CC schizophrenia. Analysis of the expression of the 17 mer nucleic acids in
CC patient samples is useful for diagnosis and/or prognosis of these
CC diseases. The polypeptides can also be used to generate antibodies, and
CC both the polypeptide and antibodies are useful as components of protein
CC chips. The nucleic acid sequences of the invention can be used in gene
CC therapy. This polynucleotide sequence represents a tumour suppression
CC related human fukutin oligonucleotide of the invention

PT Novel enzymatic nucleic acid molecules which down regulates expression of
PT a sequence encoding a subunit of nuclear factor kappa B useful for
PT treating cancer, inflammatory disorders and autoimmune diseases.
XX
PS Claim 4; Page 39; 72pp; English.
XX
CC The invention describes an enzymatic nucleic acid molecule (I) which down
CC regulates expression of a sequence encoding a subunit of nuclear factor
CC kappa B (NFKB), where (I) is an inozyme, zinzyme, G-cleaver or amberzyme
CC configuration. The enzymatic nucleic acid molecule is adapted to treat
CC cancer and is useful for down-regulating REL-A activity in a cell, for
CC treating a patient having a condition associated with the level of REL-A.
CC (I) is useful for cleaving RNA comprising a sequence of REL-A gene, in
CC the presence of a divalent cation, especially Mg^2^+. The enzymatic and
CC antisense nucleic acid molecules are useful for treating breast, lung,
CC prostate, colorectal, brain, oesophageal, stomach, bladder, pancreatic,
CC cervical, head and neck, ovarian cancer, melanoma, lymphoma, glioma or
CC multidrug resistant cancer. The method involves use of other drug
CC therapies such as monoclonal antibodies, REL-A-specific inhibitors or
CC chemotherapy including paclitaxel, docetaxel, cisplatin, methotrexate,
CC cyclophosphamide, doxorubin, fluorouracil carboplatin, edatrexate,
CC gemcitabine or radiation therapy. The enzymatic and antisense nucleic
CC acid molecules are also useful for treating inflammatory disease such as
CC rheumatoid arthritis, restenosis, asthma, Crohn's disease, diabetes,
CC obesity, autoimmune disease, lupus, multiple sclerosis, transplant/graft
CC rejection, gene therapy applications, ischaemia/reperfusion injury
CC (central nervous system (CNS) and myocardial), glomerulonephritis,
CC sepsis, allergic airway inflammation, inflammatory bowel disease or
CC infection. This sequence represents the substrate of a novel enzymatic

XX
PS   Example 8; SEQ ID NO 1303; 103pp; English.
XX
CC   The present invention relates to novel human zinc finger-containing
CC   proteins and their coding sequences: MDZ3, MDZ4, MDZ7, MDZ12. MDZ3 is
CC   encoded at chromosome 7q22.1, MDZ4 is encoded at chromosome 6p21.3-22.2,
CC   MDZ7 is encoded at chromosome 16p11.2 and MDZ12 is encoded at chromosome
CC   15q26.1. The MDZ3, MDZ4, MDZ7, and MDZ12 sequences are useful in therapy,
CC   or in manufacturing a medicament for treating or preventing a disorder
CC   associated with decreased or increased expression or activity of MDZ3,
CC   MDZ4, MDZ7, or MDZ12, e.g. cancer or developmental disorders. The nucleic
CC   acids and proteins are also useful for diagnosing or monitoring a disease
CC   caused by altered expression of MDZ3, MDZ4, MDZ7, or MDZ12. The nucleic
CC   acids can also be used as probes to detect and characterize gross
CC   alterations in MDZ3, MDZ4, MDZ7, or MDZ12 genetic locus. The probes are
CC   useful in constructing microarrays for measuring gene expression. The
CC   proteins are useful as therapeutic agents for gene therapy or as
CC   vaccines. The present sequence was used to illustrate the invention.

XX
CC   The present invention relates to nucleic acid molecules which modulate
CC   the synthesis, expression and/or stability of Hepatitis C virus (HCV) or
CC   Hepatitis B virus (HBV) RNA. The nucleic acid molecules include antisense
CC   and enzymatic nucleic acids such as hammerhead ribozymes, DNAzymes,
CC   inozymes, zinzymes, amberzymes, and G-cleaver ribozymes. Also disclosed
CC   are nucleic acid decoy molecules and aptamers that bind to HBV reverse
CC   transcriptase and/or HBV reverse transcriptase primer sequences, as well
CC   as oligonucleotides that specifically bind the Enhancer I region of HBV
CC   DNA. The nucleic acids may be used to modulate the expression of HBV
CC   genes and HBV viral replication. Also disclosed is a method for screening
CC   compounds and/or potential therapies directed against HBV, and compounds
CC   that modulate the expression and/or replication of HCV. The compounds and
CC   methods of the invention are useful for the treatment of degenerative and
CC   disease states related to HBV and HCV infection, replication and gene
CC   expression such as cirrhosis, liver failure, and hepatocellular
CC   carcinoma. The present sequence represents a substrate for one of the HCV
CC   DNAzyme or minus strand DNAzyme sequences disclosed in the present
CC   invention

CC   The present invention relates to nucleic acid molecules which modulate
CC   the synthesis, expression and/or stability of Hepatitis C virus (HCV) or
CC   Hepatitis B virus (HBV) RNA. The nucleic acid molecules include antisense
CC   and enzymatic nucleic acids such as hammerhead ribozymes, DNAzymes,
CC   inozymes, zinzymes, amberzymes, and G-cleaver ribozymes. Also disclosed
CC   are nucleic acid decoy molecules and aptamers that bind to HBV reverse
CC   transcriptase and/or HBV reverse transcriptase primer sequences, as well
CC   as oligonucleotides that specifically bind the Enhancer I region of HBV
CC   DNA. The nucleic acids may be used to modulate the expression of HBV
CC   genes and HBV viral replication. Also disclosed is a method for screening
CC   compounds and/or potential therapies directed against HBV, and compounds
CC   that modulate the expression and/or replication of HCV. The compounds and
CC   methods of the invention are useful for the treatment of degenerative and
CC   disease states related to HBV and HCV infection, replication and gene
CC   expression such as cirrhosis, liver failure, and hepatocellular
CC   carcinoma. The present sequence represents a substrate for one of the HBV

CC   The present invention relates to murine oligonucleotides (ACC62754-
CC   ACC68806), which are associated with tumour suppression, tumour
CC   reversion, apoptosis and virus resistance. The oligonucleotides are
CC   useful as (1) as probes and primers for detecting, identifying,
CC   quantifying and/or amplifying nucleic acid, e.g. as one component of a
CC   gene chip; in vitro as (anti)sense reagents; and (2) for production of
CC   recombinant polypeptides. The oligonucleotides are useful for preparation
CC   of pharmaceuticals for prevention and/or treatment of viral diseases that
CC   are characterised by development of tumours or cell degeneration,
CC   specifically cancer but also Alzheimer's disease and schizophrenia

XX
CC   The invention relates to the isolation of 6327 nucleotide sequences,
CC   fragments of at least 15 consecutive nucleotides of these nucleotides, a
CC   sequence having at least 80% identity, after optimal alignment, with the
CC   nucleotides, a sequence that hybridizes under stringent conditions with
CC   the nucleotides, or the complement, or corresponding RNA, of the
CC   nucleotides. The nucleotides are used as probes or primers for detecting,
CC   identifying, quantifying and/or amplifying nucleic acids, as in vitro
CC   sense and antisense sequences, of nucleotides involved in tumour
CC   suppression or reversion, apoptosis and or viral resistance, to produce
CC   recombinant polypeptides, and to prepare transgenic animals, as
CC   experimental models. The nucleotides (also vectors containing them and
CC   cells containing the vectors), the encoded polypeptides and antibodies
CC   (Ab) against the polypeptide are useful for prevention and/or treatment
CC   of viral infections or diseases characterized by development of tumours
CC   or cell degeneration (e.g. Alzheimer's disease or schizophrenia).
CC   Analysis of the expression of the nucleotides can be used for diagnosis
CC   and/or prognosis of these diseases. The nucleotides and polypeptides can
CC   also be used to screen for their specific interactive molecules,
CC   potentially useful for treating diseases associated with abnormal
CC   expression of the nucleotides.

PT New human sodium-hydrogen exchanger like protein 1 (NHELP1), useful as a
PT passive replacement therapy or as a vaccine for treating or preventing
PT disorders associated with aberrant expression or activity of human
PT NHELP1.
XX
PS Example 2; SEQ ID NO 561; 468pp; English.
XX
CC The invention relates to a nucleic acid molecule which encodes a Na+/H+
CC exchanger like protein (NHELP1). The NHELP1 nucleic acid molecule, NHELP1
CC polypeptide, an antibody against the protein or its antigen-binding
CC fragment is useful in therapy. The NHELP1 nucleic acid molecule, NHELP1
CC polypeptide and an agonist are particularly useful for manufacturing a
CC medicament for treating or preventing a disorder associated with
CC decreased expression or activity of human NHELP1. The antibody or its
CC antigen-binding fragment, and an antagonist, are useful for manufacturing
CC a medicament for treating or preventing a disorder associated with
CC increased expression or activity of human NHELP1. The NHELP1 nucleic acid
CC or protein is useful as passive replacement therapy, as a vaccine, or in
CC diagnostic methods. This sequence corresponds to a 17-mer oligonucleotide
CC spanning the sequence of the human NHELP1 gene (ADC03514).

XX
CC   The invention relates to the isolation of 6327 nucleotide sequences,
CC   fragments of at least 15 consecutive nucleotides of these nucleotides, a
CC   sequence having at least 80% identity, after optimal alignment, with the
CC   nucleotides, a sequence that hybridizes under stringent conditions with
CC   the nucleotides, or the complement, or corresponding RNA, of the
CC   nucleotides. The nucleotides are used as probes or primers for detecting,
CC   identifying, quantifying and/or amplifying nucleic acids, as in vitro
CC   sense and antisense sequences, of nucleotides involved in tumour
CC   suppression or reversion, apoptosis and or viral resistance, to produce
CC   recombinant polypeptides, and to prepare transgenic animals, as
CC   experimental models. The nucleotides (also vectors containing them and
CC   cells containing the vectors), the encoded polypeptides and antibodies
CC   (Ab) against the polypeptide are useful for prevention and/or treatment
CC   of viral infections or diseases characterized by development of tumours
CC   or cell degeneration (e.g. Alzheimer's disease or schizophrenia).
CC   Analysis of the expression of the nucleotides can be used for diagnosis
CC   and/or prognosis of these diseases. The nucleotides and polypeptides can
CC   also be used to screen for their specific interactive molecules,
CC   potentially useful for treating diseases associated with abnormal
CC   expression of the nucleotides.

PT New isolated nucleic acid, useful for treating viral diseases associated
PT with tumors and cell degeneration, also related polypeptides, antibodies
PT and transfected cells.
XX
PS Disclosure; SEQ ID NO 4661; 30pp; French.
XX
CC This invention relates to novel isolated nucleic acid sequences involved
CC in the phenomena of tumour suppression, tumour reversion, apoptosis
CC and/or resistance to viruses. The invention may be useful for the
CC development of compounds with a cytostatic, virucide, neuroprotective,
CC nootropic or neuroleptic activity. The DNA sequences may be useful as
CC probes and primers for detecting, indentifying, quantifying and/or
CC amplifying nucleic acid, for example as one component of a gene chip, in
CC vitro as antisense reagents and for production of recombinant
CC polypeptides. The invention may therefore be useful for preparation of
CC pharmaceuticals for prevention and/or treatment of viral diseases that
CC are characterised by development of tumours or cell degeneration,
CC specifically cancer but also Alzheimer's disease and schizophrenia. The
CC present sequence is that of a nucleic acid sequence of the invention.
CC Note: The sequence data for this patent did not form part of the printed
CC specification, but was obtained in electronic format directly from WIPO
CC at ftp.wipo.int/pub/publishedpct_sequences

PT   Novel enzymatic nucleic acid that down-regulates expression of neurite
PT   growth inhibitor receptor, prostaglandin D2 receptor, IkappaB kinase or
PT   protein kinase PKR genes, for treating cancer and inflammatory disease.
XX
PS   Claim 59; SEQ ID NO 1654; 317pp; English.
XX
CC   The invention comprises nucleic acids (e.g. antisense oligonucleotides)
CC   that down regulate the expression or inhibit the function of a receptor
CC   for a neurite growth inhibitor, NOGO, prostaglandin D2 receptor (PTGDR),
CC   IkappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the
CC   invention are useful for treating: cerebrovascular accident, central
CC   nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma,
CC   lymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis,
CC   restenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune
CC   disease, lupus, multiple sclerosis, transplant/graft rejection,
CC   ischaemia/reperfusion injury, glomerulonephritis, sepsis, and allergic
CC   conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The
CC   nucleic acids of the invention are also useful for down-regulating the
CC   expression of a target gene and as a diagnostic tool to examine genetic
CC   drifts and mutations within diseased cells or to detect the presence of a
CC   target RNA in a cell. The present RNA sequence represents a human IKK-
CC   gamma substrate sequence.

CC The invention comprises nucleic acids (e.g. antisense oligonucleotides)

```
CC   that down regulate the expression or inhibit the function of a receptor
CC   for a neurite growth inhibitor, NOGO, prostaglandin D2 receptor (PTGDR),
CC   IkappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the
CC   invention are useful for treating: cerebrovascular accident, central
CC   nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma,
CC   lymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis,
CC   restenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune
CC   disease, lupus, multiple sclerosis, transplant/graft rejection,
CC   ischaemia/reperfusion injury, glomerulonephritis, sepsis, and allergic
CC   conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The
CC   nucleic acids of the invention are also useful for down-regulating the
CC   expression of a target gene and as a diagnostic tool to examine genetic
CC   drifts and mutations within diseased cells or to detect the presence of a
CC   target RNA in a cell. The present RNA sequence represents a human PKR
CC   substrate sequence.

PT   Diagnosing glioma by detecting expression product of any one of 255
PT   genes, glioma endothelial markers, in brain tissue sample suspected of
PT   being neoplastic, and comparing the expression with expression in normal
PT   brain tissue sample.
XX
PS   Example 2; SEQ ID NO 256; 114pp; English.
XX
CC   The present invention describes a method (M1) for aiding in the diagnosis
CC   of glioma. (M1) involves detecting an expression product of at least one
CC   gene (I) in a first brain tissue sample (T) suspected of being
CC   neoplastic, where (I) is chosen from any one of 255 genes (glioma
CC   endothelial markers (GEMs)) as given in specification, and comparing the
CC   expression of (I) in (T) with expression of (I) in a second normal brain
```

```
CC   tissue sample (R), where increased expression of (I) in (T) relative to
CC   (R), identifies (T) as likely to be neoplastic. Also described: (1)
CC   treating (M2) glioma involves contacting cells of the glioma with an
CC   antibody that specifically binds to a extracellular epitope; (2)
CC   identifying (M3) a test compound as potential anticancer or antiglioma
CC   drug involves contacting a test compound with the cell which expresses
CC   (I), monitoring an expression product of the at least one gene and
CC   identifying test compound as a potential anticancer drug if it decreases
CC   the expression of at least one gene; (3) identifying (M4) a test compound
CC   as potential anticancer or antiglioma drug involves contacting a test
CC   compound with the cell which expresses mRNA of at least one gene
CC   identified by a tag as described above, monitoring mRNA of the gene, and
CC   identifying the test compound as a potential anticancer drug if it
CC   decreases the expression of at least one gene; and (4) inducing (M5) an
CC   immune response to glioma involves administering to a mammal, a protein
CC   or (I). (I) have cytostatic activities, and can be used to trigger immune
CC   destruction of glioma cells, and as immune response inducers. (M1) is
CC   useful for aiding in diagnosing glioma. (M2) is useful for treating multi
CC   -drug sensitive glioma in a human. (M5) is useful for inducing an immune
CC   response to a glioma in a mammal having glioma or in a mammal who has had
CC   a glioma surgically removed. The present sequence represents a human GEM
CC   long tag oligonucleotide, which is used in the exemplification of the
CC   present invention.

PT   Novel enzymatic nucleic acid molecule such as DNAzymes and inozymes
PT   specifically cleaving RNA derived from hepatitis B virus and comprising
PT   one or more binding arms, useful for treating hepatitis and cirrhosis.
XX
PS   Disclosure; SEQ ID NO 1073; 122pp; English.
XX
CC   The invention relates to an enzymatic nucleic acid molecule that
CC   specifically cleaves RNA derived from hepatitis B virus (HBV) and
CC   comprising one or more binding arms, without requiring the presence of a
CC   2'-OH group within the molecule for activity. The nucleic acids are
CC   useful for treating hepatitis B virus infection, hepatitis,
CC   hepatocellular carcinoma, cirrhosis and liver failure, either alone or in
CC   combination with other therapies such as lamivudine and interferons. The
CC   nucleic acids are useful as diagnostic tools to examine genetic drift and
CC   mutations within diseased cells, for detecting the presence of HBV RNA in
CC   a cell, for the study of RNA and for down-regulating gene expression of
CC   target genes in bacterial, fungal, viral, plant or mammalian cells. This
CC   sequence represents an HBV RNA target sequence, used in the scope of the
CC   invention. Note: The sequence data for this patent is also available in
CC   electronic format from USPTO at seqdata.uspto.gov/sequence.html.

PT   Decreasing intracellular cAMP levels in eosinophil(s) - by contacting
PT   cell with antagonist of A3 subtype adenosine receptor.
XX
PS   Claim 16; Page 93; 120pp; English.
XX
CC   The sequences given in AAT07594-621 are primers/probes which were used in
CC   reverse transcription PCR or in situ hybridisation experiments for the
CC   identification of expression of a particular adenosine receptor subtype.
CC   These primers and probes are esp. used in the determination of expression
CC   of the A3 adenosine receptor by human eosinophils. This is used in the
CC   identification of antagonists of A3 subtype adenosine receptors. These
CC   antagonists prevent activation of eosinophils, esp. they prevent A3
CC   inhibition of adenylate cyclase and cytokine induced hypersensitivity.
CC   They may be used for treating or preventing allergic or inflammatory
CC   diseases, e.g. asthma, rhinitis, serum sickness, atopic dermatitis,
CC   psoriasis, eczema, ulcerative colitis etc

PT   New ribozyme(s) for cleaving cholesterol ester transfer protein mRNA -
PT   useful for preventing or treating initial development, progression or
PT   regression of vascular diseases, esp. familial hypercholesterolaemia.
XX
PS   Claim 4; Page 53; 72pp; English.
XX
CC   AAT50595-T50642 represent target sequences for the human cholesterol
CC   ester transfer protein (CETP) hairpin ribozymes (see AAT50547-T50594).
CC   CETP is a 74 kD glycoprotein that facilitates neutral lipid transfer
CC   between plasma lipoproteins. The numbering of the targets refers to the
CC   position of the cleavage site in full length CETP. The ribozyme then
CC   binds to 4-6 nucleotides 5', and a variable number 3' of this site. The
CC   ribozymes are able to cleave mRNA from the gene encoding CETP, thereby
CC   blocking synthesis and/or expression of the mRNA. By inhibiting CETP, the
CC   reverse cholesterol transport (RCT) pathway can be inhibited (or
CC   eliminated) thereby preventing the reduction in size density of the high
CC   density lipoproteins (HDL), prolonging HDL half life, and therefore
CC   increasing HDL levels. The ribozymes can be used to treat conditions
CC   associated with abnormal levels of CETP, specifically atherosclerosis,
CC   peripheral vascular disease, hyperbetalipoproteinaemia, dyslipidaemia,
CC   familial hypercholesterolaemia, hypoalphalipoproteinaemia, vascular
CC   complications of diabetes, transplant, atherectomy and angioplastic
CC   restenosis. By inhibiting CETP, the levels of HDL and low density
CC   lipoproteins (LDL), and the HDL:LDL ratio are favourably altered (a
CC   decrease in LDL levels, and a corresponding increase in HDL levels). The
CC   ribozymes can also be used diagnostically to study genetic drift and
CC   mutations in diseased cells, and to detect CETP mRNA. As the ribozymes
CC   target specific regions of the CETP gene, they have low non-specific
CC   activity

PT Nucleic acid molecule modulating VEGF receptor(s) gene expression or mRNA
PT stability - useful for treating e.g. tumour angiogenesis, psoriasis,
PT rheumatoid arthritis, etc., in a human patient.
XX
PS Claim 4; Page 93; 218pp; English.
XX
CC The present invention describes nucleic acid molecules which modulate the
CC synthesis, expression and/or stability of a mRNA encoding 1 or more
CC receptors of vascular endothelial growth factor (VEGF). A patient
CC (preferably human) having a condition associated with the level of the
CC fms-like tyrosine kinase 1 (flt-1), kinase insert domain containing
CC receptor (KDR) and/or foetal liver kinase 1 (flk-1) (e.g. tumour
CC angiogenesis, ocular diseases, psoriasis and rheumatoid arthritis) can be
CC treated by administering the nucleic acid molecule or the expression
CC vector to the patient. AAX67275 to AAX75752 represent specific examples
CC of nucleic acid molecules from the present invention

PT New nucleic acid encoding two proteins imparting resistance to different
PT herbicides - and related vectors and transgenic plants, allowing
PT selective weed control using these herbicides.
XX
PS Example 8; Page 36; 90pp; English.
XX
CC This sequence represents a primer used to isolate the polynucleotide of
CC the invention. The polynucleotide of the invention has two regions each
CC expressing a protein, conferring resistance or tolerance (in a plant) to
CC a particular herbicide, provided that: (a) it does not encode a fusion
CC protein of only 5-enol-pyruvyl-3-phosphoshikimate synthetase (EPSPS) and
CC GST; (b) does not comprise only regions expressing superoxide dismutase
CC (SOD) and GST; and (c) does not comprise only regions encoding GST and
CC phosphinothricin acetyltransferase (PAT). The polynucleotide or vectors
CC containing it may be used to produce transgenic plants resistant to
CC herbicides. The polynucleotides are introduced into a wide range of
CC cereals, oilseed crops, fibre plants, fruits, vegetables, plantation
CC crops and trees to selectively control weeds in a crop field by
CC conferring to the crop resistance to the herbicides, allowing greater
CC doses of herbicides to be used. The polynucleotide may also be used for
CC high throughput screening of potential herbicides, particularly when
CC expressed in E. coli or yeast

PT   Preparation of antisense oligo:nucleotide(s) which lack long runs of
PT   consecutive guanosine or inosine - and have specific ratio of residues
PT   able to form two or three hydrogen bonds, have greater activity and
PT   reduced toxicity, used therapeutically or to modulate growth of cells in
PT   culture.
XX
PS   Example 7; Fig 9b; 286pp; English.
XX
CC   AAV49008-236 represent antisense oligonucleotides directed against the rb
CC   gene. Of these, only oligonucleotides AAV49008-52 resulted in effective
CC   downregulation of negative growth control by rb, while oligonucleotides
CC   AAV49052-236 had little effect. The oligonucleotides exemplify the
CC   invention. The specification describes oligonucleotides that contain 8-30
CC   nucleotides, which contain at most 8 nucleotides that can each form three
CC   hydrogen bonds to cytosine; do not contain four consecutive nucleotides
CC   able to form three H-bonds each to four consecutive cytosines; do not
CC   contain two sequences of three consecutive nucleotides each able to form
CC   three H-bonds to three consecutive cytosines, and the ratio between
CC   residues able to form two H-bonds each (2R) or three such bonds (3R) is
CC   given by 2R/3R = 0.33-0.72. The oligonucleotides are used to modulate
CC   expression of genes, particularly the genes for p53, ErB-2, junB, junD,
CC   TGF-beta 1 or beta 2 to control proliferation of primary cell cultures
CC   (e.g. bone marrow stem, liver or kidney cells, osteoclasts, osteoblasts
CC   and/or keratinocytes). The oligonucleotides can also be used to analyse
CC   function of proteins (by altering their expression or activity) and
CC   therapeutically, e.g. in cases of cancer or (targeting TGF) for
CC   stimulating the immune system

PT   Antisense oligonucleotides of the MEK2 kinase gene, useful in diagnostic
PT   protocols in vitro and for inhibiting the expression of MEK2 in vivo for
PT   the treatment of human hepatocellular carcinomas and breast carcinomas.
XX
PS   Claim 11; Col 39; 32pp; English.
XX
CC   The present invention describes antisense oligonucleotides (asMEK2) of
CC   the human MEK2 dual specificity kinase gene. The MEK2 gene (also called
CC   MAPKK2, mpk2, MAPK/ERK kinase 2, prmmk2 and erk activator kinase)
CC   represents a convergent target for the regulation of a range of cellular
CC   processes including proliferation, differentiation and development.
CC   asMEK2 may be used to inhibit the expression of MEK2 genes in vivo and/or
CC   in vitro. MEK2 has been shown to be over expressed in some tumour cells.
CC   Therefore, asMEK2 may be administered to a patient to treat
CC   hepatocellular carcinomas and breast carcinomas. asMEK2 may also be used
CC   as a diagnostic tool to specifically inhibit the expression of MEK2
CC   genes. The role of the inhibited genes in cellular pathways may then be
CC   evaluated. They may also be used as probes to detect sequences encoding
CC   MEK2 or as primers for the amplification of those sequences. AAZ21406 to
CC   AAZ21443 represent specifically claimed asMEK2's from the present
CC   invention

PT   Novel nucleic acids used for diagnosis and treatment of neurodegenerative
PT   diseases.
XX
PS   Claim 5; Fig 4; 14pp; German.
XX
CC   This invention describes a novel human DNA (I), encoding glial cell line-
CC   derived neurotrophic factor (GDNF). (I), also its promoter, exon
CC   fragments and primer pairs able to hybridize to it, and GDNF variants
CC   (II) encoded by the exon fragments, are used (i) to investigate
CC   regulation of GDNF at the molecular level, and to design methods for
CC   influencing this regulation and (ii) for diagnosis and treatment of
CC   neurodegenerative diseases, specifically Alzheimer's and Parkinson's
CC   diseases or amyotrophic lateral sclerosis, either by administration of
CC   GDNF variants or by inhibition with e.g. antisense nucleic acid. The
CC   promoter fragment of can also be used to identify agents that regulate
CC   (up or down) GDNF expression. (II) can be used to raise (or detect)
CC   specific antibodies (Ab) for detection of (II), in usual immunoassays. Ab
CC   are also useful therapeutically to inhibit specific GDNF variants.

PT   Assay of genetic sequences based on triplex formation from double
PT   stranded analyte - and hybrid of anchor and reporter sequences, with
PT   reporter released if triplex formation occurs, used e.g. to identify
PT   bacteria.
XX
PS   Disclosure; Col 13-14; 168pp; English.
XX
CC   The present sequence represents a potential triple-helix forming region.
CC   It can be used to demonstrate the assay of the invention. The assay
CC   comprises adding a sample containing double-stranded DNA test sequences,
CC   e.g. containing the present sequence, to an aqueous medium containing at
CC   least one complex of anchor DNA, attached to a solid support, and
CC   reporter DNA, where either a part of the anchor DNA or reporter DNA is
CC   designed to form a triple-strand structure with part of the test
CC   sequence. Triplex formation results in displacement of the reporter DNA
CC   which is detected as an indication of the presence of the DNA test
CC   sequence. The method is used to detect DNA sequences, particularly for
CC   identification of bacteria (by detecting genes for ribosomal RNA) in
CC   clinical samples, but also detection of oncogenes and Hepatitis B virus

PT Composition comprising nucleic acid and penetration enhancer - used
PT particularly for delivering therapeutic antisense oligonucleotides across
PT the gastrointestinal mucosa, provides high bioavailability.
XX
PS Example 2; Page 94; 115pp; English.
XX
CC A pharmaceutical composition has been developed which comprises a nucleic
CC acid and at least one penetration enhancer. The compositions are used:
CC (i) to treat or prevent any disease or disorder that can be treated with
CC the nucleic acid, e.g. cancer, Alzheimer's disease, beta-thalassemia,
CC malaria, viral infections (including human immune deficiency virus
CC (HIV)), inflammation, in human or animal medicine; (ii) to investigate
CC the role of a gene or gene product in non-human animals; and (iii) to
CC modulate gene expression in cells, tissues or organs. The compositions
CC provide bioavailability of at least 15, preferably 17-35,%. The
CC penetration enhancer improves: (i) transport of the nucleic acid across
CC the mucosa of the alimentary canal and into cells; and (ii) increases
CC stability of the nucleic acid. Oral administration avoids the
CC complications and expense of intravenous or other methods of
CC administration. AAX18669 to AAX18799 and AAX18801 represent antisense
CC oligonucleotides which can be used as the nucleic acid in the method of
CC the invention

XX
PS Disclosure; Page 18; 57pp; English.
XX
CC The present invention describes a method for determining whether a
CC subject is afflicted with a disorder characterised by the presence of a
CC known nucleic acid. The method comprises: (i) amplifying, in an isolated
CC sample from the subject, the nucleic acid segment that, in an affected
CC individual contains (A), (ii) treating the amplicons with a catalytic
CC nucleic acid (I) that specifically recognizes and cleaves a target
CC sequence present in either the mutated or wild-type segments, but not in
CC both; and (iii) detecting any cleavage caused by (I). Step (ii) may be
CC performed concurrently with (i). The method is specifically used to
CC diagnose cancer (especially), acquired immune deficiency syndrome and
CC cystic fibrosis. (I) recognises as few as two bp to create a cleavage
CC site (contrast at least 4 bp required by enzymes used in restriction
CC fragment length polymorphism (RFLP) analysis); such sites occur more
CC frequently than restriction enzyme sites, and mismatched primers can be
CC used to induce cleavage sites for (I). The method is potentially more
CC flexible than RFLP and does not require any enzymes or toxic compounds.

PT Detecting diseases associated with a known mutation by amplification and
PT cleavage with catalytic nucleic acids, particularly for cancer, human
PT immune deficiency virus and cystic fibrosis.
XX
PS Disclosure; Page 19; 57pp; English.
XX
CC The present invention describes a method for determining whether a
CC subject is afflicted with a disorder characterised by the presence of a
CC known nucleic acid. The method comprises: (i) amplifying, in an isolated
CC sample from the subject, the nucleic acid segment that, in an affected
CC individual contains (A), (ii) treating the amplicons with a catalytic
CC nucleic acid (I) that specifically recognizes and cleaves a target
CC sequence present in either the mutated or wild-type segments, but not in
CC both; and (iii) detecting any cleavage caused by (I). Step (ii) may be
CC performed concurrently with (i). The method is specifically used to
CC diagnose cancer (especially), acquired immune deficiency syndrome and
CC cystic fibrosis. (I) recognises as few as two bp to create a cleavage
CC site (contrast at least 4 bp required by enzymes used in restriction
CC fragment length polymorphism (RFLP) analysis); such sites occur more
CC frequently than restriction enzyme sites, and mismatched primers can be
CC used to induce cleavage sites for (I). The method is potentially more
CC flexible than RFLP and does not require any enzymes or toxic compounds.
CC AAZ34339 to AAZ34450 represent oligonucleotide sequences used in the
CC exemplification of the present invention

PT New compositions comprising sensor arrays made up of unique probe
PT oligonucleotides - useful for characterizing a sample of target deletion
PT oligonucleotides.
XX
PS Example 9; Page 115; 163pp; English.
XX
CC This invention describes a novel composition comprising a number of
CC sensor arrays, where each array comprises a unique probe oligonucleotide,
CC which is the reverse complement of part of a unique target
CC oligonucleotide present in a mixture of target deletion sequence
CC oligonucleotides. The compositions form a method for characterizing a
CC sample of target deletion oligonucleotides which are labelled and
CC hybridize with the probe oligonucleotides of the sensor arrays. Such
CC oligonucleotides and their targets are represented in AAX23548-X23709.
CC Oligonucleotides characterized by the method form pharmaceutical
CC compositions that are useful for modulating cellular adhesion or
CC proliferation, and being active against a eukaryotic pathogen, a human
CC retrovirus, a human immunodeficiency virus (HIV), or a non-human
CC retrovirus, including influenza virus, Epstein-Barr virus, Respiratory
CC Syncytial Virus or cytomegalovirus (CMV). The compositions enable

```
CC   characterization of deletion sequence oligonucleotides having related,
CC   but different nucleobase sequences, and quantification of different
CC   species of deletion sequence ("target") oligonucleotides in a mixture.
CC   Also, if the specificity of the oligonucleotide's nucleobase sequence for
CC   its reverse complement is not modified, the method may be performed using
CC   oligodeoxynucleotides

PT   New polypeptide, useful as a vaccine and to generate monoclonal
PT   antibodies.
XX
PS   Claim 31; Page 39; 63pp; English.
XX
CC   This sequence is a PCR primer for DNA encoding the AV37 antigen protein
CC   of the invention. The protein is recognised by a monoclonal antibody
CC   (MAb) secreted by the hybridoma AV37 deposited at the European Collection
CC   of Cell Cultures (ECACC) accession number 98030304. The polypeptide can
CC   be used to isolate a MAb, produce a hybridoma producing the MAb, and in a
CC   composition for use as a vaccine. The vaccine can be used against
CC   oncogenic avian viruses, including Marek's disease virus, avian leucosis
CC   virus, Rous-associated virus and reticuloendotheliosis virus. The vector
CC   can be used to treat avian tumours

PT   New hairpin and hammerhead ribozyme for inhibiting restenosis, cleaves
PT   RNA encoding a cyclin or cell-cycle dependent kinase other than CDK1,
PT   PCNA and Cyclin B1.
XX
PS   Example 1; Page 17; 109pp; English.
XX
CC   The present invention relates to a hairpin or hammerhead ribozyme,
CC   designed to cleave RNA encoding a cyclin or cell-cycle dependent kinase
CC   other than cell-cycle dependent kinases CDK1, PCNA and Cyclin B1.
CC   Representative examples of ribozyme recognition sites are given in
CC   AAA82415 to AAA86787. The ribozyme of the invention is useful for
CC   inhibiting restenosis by introduction of the ribozyme into cells. The
CC   ribozyme is resistant to endonuclease activity and hence is efficient in
CC   restenosis treatment

PT   Antisense oligonucleotides, useful for inhibiting human Ship-2 expression
PT   and for detecting nucleic acids encoding Ship-2.
XX
PS   Example 15; Col 39; 34pp; English.
XX
CC   The present invention describes phosphorothioate antisense
CC   oligonucleotides that specifically hybridise with, and inhibit the
CC   expression of, nucleic acids encoding human Ship-2 (also called SH2-
CC   containing phosphatidylinositol phosphatase-2). Also described is a
CC   method of inhibiting the expression of Ship-2 in human cells or tissues
CC   in vitro comprising contacting the cells with the phosphorothioate
CC   antisense oligonucleotides. The phosphorothioate antisense
CC   oligonucleotides can be used to treat animals (especially humans)
CC   suspected of having or being prone to a disease or condition associated
CC   with Ship-2 expression. The present sequence represents a
CC   phosphorothioate antisense oligonucleotide for human Ship-2, from the
CC   present invention

XX
CC   Sequences AAZ49357-Z49358 represent antisense oligonucleotides designed
CC   to have therapeutic activity against beta-thalassaemia. The invention
CC   relates to new compositions for the non-parenteral delivery of
CC   oligonucleotides comprising at least one oligonucleotide in an emulsion.
CC   Oligonucleotides delivered via the compositions of the invention can be
CC   used to modulate expression of a cellular adhesion protein, modulate a
CC   rate of cellular proliferation, or have biological activity against
CC   eukaryotic pathogens or retroviruses. They can be used for treating
CC   conditions including e.g., ulcerative colitis, Crohn's disease,
CC   inflammatory bowel disease or undue cellular proliferation. The
CC   compositions can enhance the local and systemic uptake and delivery of
CC   nucleic acids via non-parenteral routes of administration (e.g., via the
CC   alimentary canal, skin, eyes, pulmonary tract, urethra or vagina)

```
CC   The present invention relates to an oligonucleotide array comprising
CC   oligonucleotide tags fixed to a solid substrate. The oligonucleotide
CC   array is useful for genotyping a nucleic acid sample at one or more loci
CC   via single base extension (SBE) reactions. A pair of primers is used to
CC   amplify a polymorphic locus in a sample e.g. a single nucleotide
CC   polymorphism (SNP). The present sequence is one of the primers used in
CC   the method of the present invention to amplify a polymorphic sample. The
CC   amplified nucleic acid product is then used as a template in a SBE
CC   reaction with an extension primer. The SBE reaction products are used to
CC   form the oligonucleotide array

PT   Treating proliferative skin or eye diseases and scarring, using ribozymes
PT   that cleave RNA encoding cytokines involved in inflammation, matrix
PT   metalloproteinases, growth factors and cell-cycle dependent kinases.
XX
PS   Disclosure; Page 376; 408pp; English.
XX
CC   The present invention describes a method for treating a proliferative
CC   skin or eye disease and scarring. The method involves administering a
CC   ribozyme (I) which cleaves RNA encoding a cytokine involved in
CC   inflammation, matrix metalloproteinase (MMP), cyclin, cell-cycle
CC   dependent kinase, growth factor or a reductase, or administering a
CC   nucleic acid molecule (II) comprising a promoter operably linked to a
CC   nucleic acid segment encoding (I). (I) can have antipsoriatic,
CC   dermatological, cytostatic, antiseborrheic, antidiabetic, antisickling,
CC   ophthalmological, vulnerary, keratolytic and virucide activities, and
CC   cleaves RNA encoding cytokine involved in inflammation. (I) can be used
CC   in gene therapy. (I) and (II) are useful for treating proliferative skin
CC   diseases such as psoriasis, atopic dermatitis, actinic keratosis,
CC   squamous or basal cell carcinoma and viral or seborrheic wart. They can
CC   also be used for treating proliferative eye diseases such as diabetic
CC   retinopathy, vitreoretinopathy, sickle cell retinopathy, retinopathy of
CC   prematurity and retinal detachment, and for treating and preventing
CC   scarring such as keloid, adhesion and hypertrophic or hypertrophic burn
CC   scar. AAH57577 to AAH62099 represent sequences used in the
CC   exemplification of the present invention

PT   Arraying genome clones.
XX
PS   Claim 4; Page 19; 528pp; Japanese.
XX
CC   The present invention describes a method of arraying genome clones. The
CC   method comprises: (a) clones of the genomic libraries contained in
CC   multiwell plates numbered for discrimination are mixed in each of the
CC   multiwell plates; (b) a primer designed based on the chromosome marker
CC   sequence is added to the mixture to carry out an amplification reaction;
CC   (c) a signal corresponding to the marker is detected from the resultant
CC   amplified product to specify the discrimination Nos. of the multiwell
CC   plates containing the clones having said marker sequence; (d) the order
CC   of the markers is changed so that the same discrimination Nos. succeed to
CC   the maximum in the specified discrimination Nos. to array the multiwell
CC   plates; (e) the clones in the multiwell plates of the specified
CC   discrimination Nos. are mixed respectively in each wells of longitudinal
CC   and lateral directions; (f) the mixed clones are cultured and the
CC   resultant cultures are amplified by using the above primer; (g) signals
CC   are detected from the amplified products; (h) the clones in the multiwell
CC   plates are specified from the detected result; and (i) the clones are
CC   reconstituted as the positions on the chromosome and arrayed. The
CC   microarray is useful for gene analysis. ABL42957 to ABL45322 represent
CC   PCR primers for human chromosome 1p36-35 DNA, and ABL45323 to ABL45634
CC   represent PCR primers for human chromosome 21q22.1, which are

PT   Arraying genome clones.
XX
PS   Claim 4; Page 34; 528pp; Japanese.
XX
CC   The present invention describes a method of arraying genome clones. The
CC   method comprises: (a) clones of the genomic libraries contained in
CC   multiwell plates numbered for discrimination are mixed in each of the
CC   multiwell plates; (b) a primer designed based on the chromosome marker
CC   sequence is added to the mixture to carry out an amplification reaction;
CC   (c) a signal corresponding to the marker is detected from the resultant
CC   amplified product to specify the discrimination Nos. of the multiwell
CC   plates containing the clones having said marker sequence; (d) the order
CC   of the markers is changed so that the same discrimination Nos. succeed to
CC   the maximum in the specified discrimination Nos. to array the multiwell
CC   plates; (e) the clones in the multiwell plates of the specified
CC   discrimination Nos. are mixed respectively in each wells of longitudinal
CC   and lateral directions; (f) the mixed clones are cultured and the
CC   resultant cultures are amplified by using the above primer; (g) signals
CC   are detected from the amplified products; (h) the clones in the multiwell
CC   plates are specified from the detected result; and (i) the clones are
CC   reconstituted as the positions on the chromosome and arrayed. The
CC   microarray is useful for gene analysis. ABL42957 to ABL45322 represent
CC   PCR primers for human chromosome 1p36-35 DNA, and ABL45323 to ABL45634
CC   represent PCR primers for human chromosome 21q22.1, which are
CC   specifically claimed for use in the present invention

PT   Novel cell having pre-trans-splicing molecules with target binding
```

PT domains that target binding of PTM to pre-mRNA, 3' or 5' splice region,
PT spacer region, nucleotide sequence to be trans-spliced to target-pre-
PT mRNA.
XX
PS Example; Page 41; 229pp; English.
XX
CC The present invention describes a cell (I) comprising pre-trans-splicing
CC molecules (PTMs) (II) which have one or more target binding domains (IIa)
CC that target binding of PTM to pre-mRNA, 3' splice region (IIb) that
CC includes branch point pyrimidine tract and 3'splice acceptor site, or 5'
CC splice site (IIc), spacer region (IId) that separates RNA splice site
CC from target binding domain, and nucleotide sequence to (IIe) be trans-
CC spliced to target-pre-mRNA. Optionally, the cell comprises (II) either
CC comprising: (A) (IIb) and (IIe); or (B) (IIc), (IId) and (IIe). The cell
CC may comprise a recombinant vector expressing (II). (I) has cytostatic,
CC immunosuppressive and antimicrobial activities, and can be used in gene
CC therapy. (II) comprising one or more (preferably two or more) (IIa) and
CC (IIb) (or (IIc)), (IId) and (IIe), or (II) comprising either (A) or (B)
CC (excluding (IId)), is useful for producing a chimeric RNA molecule in a
CC cell which involves contacting a target pre-mRNA expressed in the cell
CC with (II) that is recognised by nuclear splicing components. The chimeric
CC RNA produced comprises sequences encoding a toxin or translatable
CC protein. The nucleotide sequence to be trans-spliced to target pre-mRNA
CC preferably comprises nucleotide sequences comprising exons 1-10 of cystic
CC fibrosis trans-membrane conductance regulator (CFTR). The chimeric RNA
CC molecule produced using (II) which either comprises (A) or (B) further
CC comprises a nucleotide sequence tag. (I) can be used for gene regulation,
CC gene repair and targeted cell death. (I) can be used for the treatment of
CC various diseases including genetic, infectious or autoimmune diseases and
CC proliferative disorders such as cancer and to regulate gene expression in
CC plants. ABQ73414 to ABQ73536 represent sequences used in the
CC exemplification of the present invention

PT   A triple-helix comprising a double helical nucleic acid (DHNA) and an
PT   oligonucleotide which binds in parallel and antiparallel orientation,
PT   respectively, for targetting sequences on alternate strands of DHNA to
PT   control gene expression.
XX
PS   Example 7; Col 41; 108pp; English.
XX
CC   The present invention relates to methods and oligonucleotides for forming
CC   a triple-helix comprising a double helical nucleic acid comprising first
CC   and second substantially complementary strands, and an oligonucleotide
CC   bound to a purine-rich target sequence within the double helical nucleic
CC   acid, where the oligonucleotide binds in a parallel and antiparallel
CC   orientation, respectively, to target sequences on alternate strands of
CC   the double helical nucleic acid. The method has therapeutic applications,
CC   where gene expression is controlled by selective triple-helix formation
CC   within expression regulatory sequences of a target gene. The
CC   oligonucleotides can be used to form triple-helices, and are useful to
CC   detect the presence or absence of specific sequences within genomic DNA
CC   for diagnostic and therapeutic purposes. The oligonucleotides can be
CC   selected to specifically bind to pathogenic double-stranded DNA including
CC   specific sequences required by pathogenic bacteria or viruses for
CC   replication or virulence, reducing their pathogenicity. Alternatively,
CC   the oligonucleotide can be chosen to target a unique sequence of the
CC   pathogen which is not found in the genome of pathogen's host. The
CC   oligonucleotides can be used in cancer treatment by way of triple-helix
CC   suppression of specific oncogenes including those of endogenous or viral
CC   origin. Such therapeutic oligonucleotides are capable of forming triple-
CC   helices with such sequences in cancerous cells containing the activated
CC   oncogene, so preferentially killing or repressing the cancer causing
CC   cell. The present sequence represents an oligonucleotide used in the
CC   methods of the present invention

CC The present invention describes a method for detecting and
CC differentiating between haematopoietic cell proliferative disorders
CC associated with at least 1 gene and/or their regulatory regions in a
CC subject. The method comprises contacting a target nucleic acid in a
CC biological sample obtained from the subject with at least 1 reagent,
CC which distinguishes between methylated and non-methylated CpG
CC dinucleotides within the target nucleic acid. ABZ09861 to ABZ11118
CC represent specifically claimed nucleotide sequences from the present
CC invention. Oligonucleotides from the present invention can be used: for
CC differentiating between healthy haematopoietic cells and proliferative
CC disorder haematopoietic cells; for differentiating between acute
CC lymphocytic leukaemia and acute myelogenous leukaemia; as probes for
CC determining the cytosine methylation state and/or single nucleotide
CC polymorphisms (SNPs) of haematopoietic cell proliferation disorder
CC related sequences and their complements; and as primers for the
CC amplification of haematopoietic cell proliferation disorder related DNA
CC sequences. The nucleotide sequences from the present invention can also
CC be used for detecting a predisposition to, differentiation between
CC subclasses, diagnosis, prognosis, treatment and/or monitoring of
CC haematopoietic cell proliferative disorders. The present method enables a
CC highly specific classification of haematopoietic cell proliferative
CC disorders allowing for improved and informed treatment of patients

CC represent specifically claimed nucleotide sequences from the present
CC invention. Oligonucleotides from the present invention can be used: for
CC differentiating between healthy haematopoietic cells and proliferative
CC disorder haematopoietic cells; for differentiating between acute
CC lymphocytic leukaemia and acute myelogenous leukaemia; as probes for
CC determining the cytosine methylation state and/or single nucleotide
CC polymorphisms (SNPs) of haematopoietic cell proliferation disorder
CC related sequences and their complements; and as primers for the
CC amplification of haematopoietic cell proliferation disorder related DNA
CC sequences. The nucleotide sequences from the present invention can also
CC be used for detecting a predisposition to, differentiation between
CC subclasses, diagnosis, prognosis, treatment and/or monitoring of
CC haematopoietic cell proliferative disorders. The present method enables a
CC highly specific classification of haematopoietic cell proliferative
CC disorders allowing for improved and informed treatment of patients

PT New oligonucleotides are useful to detect filamentous bacteria in
PT samples, particularly in activated sludge.
XX
PS Claim 1; Page 24; 26pp; German.
XX
CC This invention describes a novel oligonucleotide which hybridises with
CC and detects a nucleic acid from a filamentous bacteria cell. The
CC filamentous bacteria can include members of the 021N Kanagawa group I, II
CC or III, 021N-like from BIO33 EU21, Alisphaera europaea EU24 Nostocoida
CC limicola-like, Alisphaera (europaea, PPx3, MC2), Alisphaera MC2 MACOBS-
CC Clone 2 (BIO 36), Bactothrix amylovora (EU3, EU4, EU8, EU9, EU11),
CC Chloroflexus aurantiacus, Curtrnema variabilis (type 0041), Cytophaga,
CC EPTS Australian 021N isolate (EU21), EPTS Australian isolate EU23 from
CC SAN3, Flexibacter, Herpetosiphon, H. aurantiacus, Leptothrix discophora,
CC Megathrix sidereus EU26 Nostocoida/021N-like, M. tenacis (WU12, EU5, EU6,
CC EU15, EU13, EU14 EU1, EU10, EU2), Nostocoida limicolasne (EU24),
CC Nostocoida limicola-like Rhodobacter sphaeroidessne, Thiothrix 021N-
CC group, Thiothrix ramose, Type 0411 (CF) and Type 0803. When detecting
CC filamentous bacteria the oligonucleotide is preferably coupled with a
CC fluorescent, chemiluminescent, radioactive, enzymatic or hapten marker.
CC Detection is by epiflourescence microscopy or flow cytometry. The
CC invention is used to detect filamentous bacteria in a sample,
CC particularly in activated sludge. ADA83682-ADA83723 represent
CC oligonucleotide probes used in the detection method of the invention.

PT Determining allele frequencies in a nucleic acid molecule population,
PT comprises performing primer extension reaction using a primer that binds
PT at a predetermined site in the nucleic acid molecules to obtain
PT nucleotide incorporation.
XX
PS Example 1; Page 13; 38pp; English.
XX
CC The invention discloses a method for determining the frequency of allele
CC in a population of nucleic acid molecules comprises pooling the nucleic
CC acid molecules of the population, performing primer extension reactions
CC using a primer that binds at a predetermined site located in the nucleic
CC acid molecules, and obtaining a pattern of nucleotide incorporation. Also
CC claimed is a kit carrying out the method above, comprising optionally
CC primer(s) for in vitro amplification, a primer for the primer extension
CC reaction, nucleotides for amplification and/or of the primer extension
CC reaction, a polymerase enzyme for the amplification and/or primer
CC extension reaction, and a means for detecting primer extension,
CC determining the amount of an allele in a sample of nucleic acid
CC molecules, determining which and/or how many nucleotides are incorporated
CC in the reaction and analysing the nucleotide incorporation information
CC obtained to determine the amount of occurrence of the allele in the
CC sample. The primer extension reaction is performed by sequentially adding
CC nucleotides to the reaction mixture, and determining the (non-
CC)incorporation of each nucleotide, where the amount of nucleotide
CC incorporated is determined quantitatively by detecting the release of
CC pyrophosphate. Enzymatic luminometric inorganic pyrophosphate detection
CC assay (ELIDA) detection enzymes are used to detect the release of
CC pyrophosphate, and a nucleotide-degrading enzyme is included during the
CC primer extension reaction. The method is useful for determining allele
CC frequencies for single nucleotide polymorphisms (SNPs) or other mutations
CC or genetic variations (e.g. nucleotide insertions, additions or
CC deletions) in pooled nucleic acid samples or other samples, which may
CC contain allelic variants. The method may also be used to confirm whether
CC an allelic variant is present in a population, in studies of mutations
CC associated with cancer, for testing genetic drift to determine if the
CC frequency of an allele changes over time, for quantification of a
CC gene/allele in human samples for trisomy tests, and to determine the
CC exact sequence of the SNP or allelic variant together with a direct
CC measurement of nucleotide incorporated. The method is accurate, simple,
CC reproducible, reliable and does not need labels or rely on probe binding
CC to the SNP site. The sequence presented is a PCR primer used to detect an
CC SNP.

PT Determining the susceptibility of an individual to a neuropsychiatric
PT disorder (e.g. schizophrenia) or diagnosing or prognosing the disorder
PT comprises using a pericentriolar material 1 marker in the chromosomal
PT region 8p21-22.
XX
PS Claim 9; Fig 6; 108pp; English.
XX
CC This invention describes a novel method of determining the susceptibility
CC to or diagnosis of schizophrenia comprising using a marker located in the
CC chromosomal region 8p21-22. The method involves determining the presence
CC or absence in a test sample of a pericentriolar material 1 (PCM1) marker
CC which is selected from any of the microsatellite repeats present in the
CC NT 000501 contig on chromosome 8p21-22 or a polymorphic marker which is
CC in linkage disequilibrium with the chromosome. The PCM1 marker is
CC preferably D8S261, D8S2615 or D8S2616 and lies within the PCM1 gene. The
CC novel method involves assessing two or more of the PCM1 markers single
CC nucleotide polymorphisms (SNPs). The PCM1 gene is amplified, particularly
CC within the intronic sequence 3' to exon 4, in exon 4, or in the intronic
CC sequence 5' of exon 5. The PCM1 marker is assessed by strand conformation
CC polymorphic marker analysis, heteroduplex analysis or restriction
CC fragment length polymorphism (RFLP) analysis. Schizophrenia therapy
CC comprises screening an individual for a genetic predisposition to
CC schizophrenia, where the predisposition is correlated with the PCM1
CC marker and if a predisposition is identified, providing therapeutic
CC treatment for the individual. Alternatively, the method comprises
CC administering to a patient a substance that modulates the expression from
CC the PCM1 gene or a gene located within 1000 kbase of the PCM1 locus. This
CC sequence represents the human PCM1 exon 26 splice donor region.

PT Detection of chromosomal abnormalities e.g. Down's Syndrome, non-
PT invasively in a fetus, comprises forming a ratio of amounts of alleles at
PT a locus of interest and a different heterozygous locus.
XX
PS Example 7; Page 157; 164pp; English.
XX
CC This invention relates to a novel method of detecting chromosomal
CC abnormalities by determining the sequence of alleles of a locus of
CC interest from template DNA, determining which alleles are present and
CC comparing to amounts of alleles at a different, selected heterozygous
CC locus (for example on another chromosome or a maternal locus); relative
CC amounts are expressed as a ratio indicating presence or absence of the
CC abnormality. The method is useful for the detection of genetic disorders,
CC especially in a foetus, including chromosomal abnormalities and
CC mutations, for example translocations, transversions, monosomies,
CC trisomies (for example trisomy 21 in which an additional copy of
CC chromosome 21 results in Down's Syndrome) and other anueoplodies,
CC deletions, additions, amplifications, translocations and rearrangements.
CC It can be used to detect any alterations in a gene sequence, especially
CC single nucleotide polymorphisms (SNPs), and may be used to detect
CC numerous abnormalities simultaneously, for example if several SNPs are
CC associated with a particular disease. The method provides a rapid, non-
CC invasive method for determining the sequence of DNA from a foetus using a
CC sample from a pregnant female, for example to detect genetic disorders as
CC above or to determine if a foetus is a carrier of a disease or
CC predisposed to a disease.

PT Determining a sequence of a locus of interest comprises replicating a
PT region of DNA comprising a locus of interest from a template
PT polynucleotide by using a first and a second primer.
XX
PS Example 5; Page 136; 190pp; English.
XX
CC The invention relates to a novel method for determining the sequence of a
CC locus of interest which comprises replicating a region of DNA comprising
CC a locus of interest from a template polynucleotide by using a first and a
CC second primer where the second primer contains a sequence that generates
CC a recognition site for a restriction enzyme such that digestion with the
CC restriction enzyme generates a 5' overhang containing the locus of
CC interest. The method may be useful for determining the sequences of
CC multiple loci of interest concurrently and for determining the sequence
CC of a mutant allele in the presence of a normal allele. The current
CC sequence is that of the human APC (adenomatous polyposis coli) DNA
CC fragment of the invention which is located on chromosome 5q21-22 and in
CC which mutations are associated with colorectal cancer.

PT   New method for preparing an oligonucleotide useful e.g. in therapeutics
PT   comprises treating derivatized solid support with acidic reagent to
PT   deblock acid labile hydroxyl protecting group and reacting with
PT   phosphoramidite and conjugate group.
XX
PS   Example 29; Page 69; 111pp; English.
XX
CC   The invention relates to a method for preparing an oligonucleotide by
CC   treating derivatised solid support with acidic reagent to deblock acid
CC   labile hydroxyl protecting group and reacting with phosphoramidite and
CC   conjugate group. The method is useful for preparing compounds containing
CC   phosphorus functionalities and oligomeric compounds containing monomeric
CC   subunits joined by functionalities such as phosphite, phosphodiester,
CC   phosphorothioate and/or phosphorodithioate residue; in diagnostics,
CC   therapeutics and as research reagents and kits; for treating organisms
CC   having a disease characterised by the undesired production of a protein.
CC   The present sequence is an oligonucleotide used to illustrate the method
CC   of the invention

PT   Modulation of in vivo uptake of a peptide nucleic acid compound useful as
PT   e.g. antisense reagent involves modifying the peptide nucleic acid
PT   molecule with a positively charged conjugate having at least three
PT   positively charged amino acids.
XX
PS   Example 3; SEQ ID NO 4; 14pp; English.
XX
CC   The invention relates to the modulation of in vivo uptake of a peptide
CC   nucleic acid compound which comprises modifying the peptide nucleic acid
CC   molecule with a positively charged conjugate having at least three
CC   positively charged amino acid units. The method is useful for modulating
CC   in vivo uptake of peptide nucleic acid compounds (such as increasing
CC   cellular uptake and modulating tissue distribution, which are useful for
CC   diagnostics and therapeutics, as research reagents and as antisense
CC   reagents. The modified peptide nucleic acid molecule exhibits enhanced
CC   intracellular accumulation, antisense efficacy and tissue distribution
CC   than that of single charged peptide nucleic acid (PNA), neutral PNA
CC   compounds and neutral or anionic charged antigen compounds. The present
CC   sequence represents an antisense oligonucleotide of the invention.

PS   Claim 8; SEQ ID NO 903; 455pp; Japanese.
XX
CC   The present invention relates to human nucleic acid sequences (I;
CC   ADO15739-ADO15912) obtained from 4 synthesis-period (stage 4S) of
CC   neuroblastoma cell. (I) is useful for prognosing and determining the
CC   progress stage of 4 synthesis-period of neuroblastoma. The present
CC   sequence is a primer, used to illustrate the invention.

XX
PT New isolated Poly(ADP)-ribose polymerase (PARP-e) nucleic acids and
PT proteins, useful for modulating chromatin structure resulting in
PT modulation of gene activation, gene repression and chromatin condensation
PT or decondensation.
XX
PS Example 7; SEQ ID NO 5; 75pp; English.
XX
CC The present invention relates to the identifiation and cloning of poly-
CC (ADP) ribose polymerase (PARP) polypeptide and its encoding
CC polynucleotide. The invention is useful for modulating chromatin
CC structure resulting in modulation of gene activation, gene repression and
CC chromatin condensation and decondensation by using PARP and its isoforms
CC PARP-e and PARP-1. The invention is therefore useful to specifically
CC manipulate chromatin structure and re-programming so as to effect
CC expression of a gene or genes of interest in order to treat or prevent
CC disease and/or to manipulate biological processes in vivo and in vitro.
CC The invention is also useful in gene therapy. The present sequence is
CC Drosophila melanogaster PARP-I and PARP-e amplifying RT-PCR primer. This
CC sequence is used in the exemplification of the invention.

  TITLE     Direct Submission
  JOURNAL   Submitted (21-NOV-2002) Balzergue S., UMRGV, INRA/CNRS, 2 rue
            Gaston Cremieux, 91057 Evry cedex, FRANCE
COMMENT     PCR was performed on DNA from transformants of Arabidopsis thaliana
            plants from INRA (Versailles). The DNA fragment(s) resulting from
            the PCR were directly sequenced from the left or the right border
            to determine the genomic sequence flanking the insertion. T-DNA
            derived sequences were removed. Information to order the
            corresponding mutant line and a link to a database providing a
            graphical display of the insertion site are available at
            http://dbsgap.versailles.inra.fr/publiclines/. This sequence has
            been generated in the framework of the French plant genomics
            program 'Genoplante' (http://www.genoplante.com and
            http://genoplante-info.infobiogen.fr).

  JOURNAL   Submitted (21-NOV-2002) Balzergue S., UMRGV, INRA/CNRS, 2 rue
            Gaston Cremieux, 91057 Evry cedex, FRANCE
COMMENT     PCR was performed on DNA from transformants of Arabidopsis thaliana
            plants from INRA (Versailles). The DNA fragment(s) resulting from
            the PCR were directly sequenced from the left or the right border
            to determine the genomic sequence flanking the insertion. T-DNA
            derived sequences were removed. Information to order the
            corresponding mutant line and a link to a database providing a
            graphical display of the insertion site are available at
            http://dbsgap.versailles.inra.fr/publiclines/. This sequence has
            been generated in the framework of the French plant genomics
            program 'Genoplante' (http://www.genoplante.com and
            http://genoplante-info.infobiogen.fr).
